Standard Operating Procedures

Developed and approved through a collaborative process involving the Region 8 Resource Hospitals: 
Central DuPage, Edward, Good Samaritan, Loyola

THEY SHALL BE UTILIZED:
★ as the written orders of a physician for treatment to be administered by authorized members of the Region 8 EMS Systems, as circumstances allow, for the treatment of the ill or injured patient.
★ as the prehospital standing medical orders to be initiated by System EMTs or Pre-Hospital RNs until such time that online medical control is established. In the event that online medical control communications cannot be established, EMS providers shall continue to provide treatment to the degree authorized by the EMS Medical Directors in these protocols.
★ in disaster situations as the standing medical orders for patient treatment, given that usual and customary forms of communication are not possible, in accordance with area-wide disaster plans.
★ as the standard operating procedures to be used by ECRNs when directing prehospital care.

System members are authorized to carry out these procedures to the extent necessitated by patient condition. Medical Control contact should be established as soon as practical. Some SOPs, designated by the header notation of Time Sensitive, emphasize early contact with Medical Control, which can benefit the patient by minimizing the time to definitive care.

It is recognized that hospice patients, patients with valid DNR/POLST orders, patients who have not responded to ALS procedures, or patients involved in a mass casualty incident (MCI) present unique circumstances that may, in the medical opinion of the Medical Control Physician, justify deviation from these procedures, including bypass of the closest destination.

Standing Orders that are not labeled either ADULT or PEDIATRIC have elements applying to all age groups. Unless otherwise noted, PEDIATRIC patients are ≤ 15 years.

Steven Graham, M.D., F.A.A.E.M.  
EMS Medical Director

EMERGING INFECTIOUS DISEASE GUIDANCE

DEFIBRILLATION & CARDIOVERSION ENERGIES

ADDITIONAL SECTION

TOC IV
The Standard Operating Procedures assume that certain tasks will be done simultaneously by EMS Providers. The order in which the tasks appear is not necessarily in order of need or importance.

<table>
<thead>
<tr>
<th>OUTLINE FOR RADIO REPORT</th>
</tr>
</thead>
</table>

TRANSMIT THE FOLLOWING, BEING AS CONCISE AS POSSIBLE:

1. Name and vehicle number of provider, desired destination, and ETA. Indicate if desired destination is the nearest by travel time, and any reasons for desiring to transport to other than the nearest hospital.

2. Patient age, sex, and approximate weight.

3. Level of consciousness and orientation.

4. Chief complaint and paramedic impression, including severity:
   - symptoms, degree of distress, severity of pain on a scale of 0-10
   - mechanism of trauma/pertinent scene information
   - pertinent negatives/associated complaints

5. Signs
   - GCS
   - Pulse - rate, quality, regularity
   - Blood Pressure - auscultated or palpated
   - Respiration - rate, pattern, depth
   - Skin - color, temperature, moisture, turgor
   - Pupils – size, equality, reactivity
   - Lung Sounds

6. History
   - Signs and Symptoms
   - Allergies
   - Medications: time and last dosage taken (bring all medications to ED)
   - Past history of pertinent illness/injury
   - Last oral intake (food or fluid) if known, Last Menstrual Period
   - Events surrounding event

7. Clinical findings
   - Assessment findings from review of systems - pertinent (+) and (-) findings
   - Interpretation of ECG and vital signs
   - Blood glucose for patients with altered mental status
   - Body temperature when appropriate
   - Cincinnati Prehospital Stroke Scale when appropriate
   - Trauma score parameters if appropriate
GENERAL PATIENT ASSESSMENT

BLS / ALS
1. Assess and secure scene safety
2. Use situationally-appropriate personal protective equipment (PPE) and procedures on all patients
   - Consider EMERGING INFECTIOUS DISEASE GUIDANCE, p. 125 for all patients with complaint and symptom profiles that are similar to those diseases

ADULT
3. Adult Initial Assessment
   - Airway – establish and maintain an airway. Consider Spinal Motion Restriction as indicated.
   - Breathing – assess; assist or provide ventilations as indicated; assess lung sounds
   - Circulation – check pulse and control hemorrhage
   - Disability – neurologic
     A – Alert
     V – responds to Verbal stimuli
     P – responds to Painful stimuli
     U – Unresponsive
   - Expose and examine as indicated
   - Identify priority transports

4. Focused History and Physical Exam
   - Signs & Symptoms, Systematic head-to-toe assessment including Glasgow Coma Scale (GCS)
   - Allergies
   - Medications
   - Pertinent Medical History
   - Last oral intake, Last Menstrual Period
   - Events leading to present condition
   - Initial set of vital signs
   - Rate pain 0-10 scale

5. Detailed Physical Exam (patient and injury specific when appropriate)

6. Ongoing Assessment
   - Reassess ABCDs
## CONSIDERATION FOR PATIENTS WITH SPECIAL HEALTHCARE NEEDS

- Track Adults and Children with Special Healthcare Needs in your service area and become familiar with both the patient as well as their anticipated emergency care needs.

- Refer to patient's emergency care plan formulated by their medical providers, if available. Understanding the patient's baseline will assist in determining the significance of altered physical findings. Parents or caregivers are the best source of information on: medications, baseline vitals, functional level/normal mentation, likely medical complication, equipment operation and troubleshooting, emergency procedures.

- Regardless of underlying conditions, assess in a systematic and thorough manner. Use parents/caregivers/home health nurses as medical resources.

- Be prepared for differences in airway anatomy, physical development, cognitive development, and possible existing surgical alterations or mechanical adjuncts. Common home therapies include: respiratory support (oxygen, apnea monitors, pulse oximeters, tracheostomies, and mechanical ventilators), cardiac devices (LVADs, continuous infusions), nutrition therapy (nasogastric or gastrostomy feeding tubes), intravenous therapy (central venous catheters), urinary catheterization or dialysis (continuous ambulatory peritoneal dialysis), biotelemetry, ostomy care, orthotic devices, communication or mobility devices or hospice care.

- Communicate with the patient in an age appropriate manner. Maintain communication with and remain sensitive to the parents/caregivers and the patient.

- The most common emergency encountered with pediatric patients is respiratory related, so familiarity with respiratory emergency interventions, adjuncts, and treatment is important and appropriate.
ADULT INITIAL MEDICAL CARE

BLS/ALS
1. Loosen tight clothing and reassure patient
2. Place patient in Semi-Fowler's position or position of comfort unless contraindicated.
3. Enhance airway adequacy by suctioning and/or insertion of an oropharyngeal or nasopharyngeal airway as needed
4. Evaluate oxygen saturation and consider need for supplemental oxygen, especially for patients with dyspnea, suspected hypoxemia or altered mental status

Target SpO2 94-98% (92% if hx of COPD)

<table>
<thead>
<tr>
<th>Respiratory Assessment / Findings</th>
<th>Oxygen Administration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adequate rate/depth, minimal distress, mild hypoxia, baseline SpO2 92-94% (88-91% COPD)</td>
<td>Low FiO2</td>
</tr>
<tr>
<td>Adequate rate/depth, moderate/severe distress, SpO2 &lt; 92% (&lt; 88% COPD)</td>
<td>High FiO2</td>
</tr>
<tr>
<td>Inadequate rate/depth with moderate/severe distress, unstable</td>
<td>High FiO2 by BVM ventilation</td>
</tr>
</tbody>
</table>

- Hyperoxia contraindicated in uncomplicated myocardial infarction / STEMI, post-cardiac arrest, acute exacerbations of COPD, stroke, newly born / neonatal resuscitation. If supplemental oxygen is used in these patients, the goal is to relieve hypoxemia without causing hyperoxia (target SpO2 94%, not 100%).

5. Consider nasal cannula waveform capnography for spontaneously breathing patients with respiratory distress and/or metabolic disorders.

ALS
- If intubated, use capnography, end tidal CO₂ detector and/or esophageal detection device per System-specific policy.
- If unable to intubate, consider use of alternate Advanced Airway (Combitube™, King LT®).

6. If altered mental status:
- Place patient on side (vomiting precautions), unless contraindicated
- Check glucose level. If glucose < 60, treat per ADULT DIABETIC / GLUCOSE EMERGENCIES, p. 30

7. Evaluate cardiac rhythm if indicated. All ALS patients do not necessarily require continuous ECG monitoring or transmission of a strip to the telemetry base station.
   **Note:** Consider 12-lead ECG on all patients with cardiac-related complaints (pain, dysrhythmias), syncope and stroke.

8. Establish venous access via IV of NORMAL SALINE (NS) at 10 mL/hr with regular drip tubing or consider SALINE LOCK as indicated by patient condition. Attempt x 2 unless requested to continue or situation indicates.
- Continuing use of central venous access devices is acceptable for transport if initiated by RN or physician. Document the name of the on-scene healthcare
# ADULT INITIAL MEDICAL CARE

A provider or trained caregiver, i.e., parent. Contact Medical Control prior to administration of any medications.

- If patient encountered with continuous infusion devices or home medication devices, transport unaltered and contact Medical Control.
- Per System-specific policy, **INTRAOSSEOUS ACCESS** may be used in patients for whom vascular access is urgently needed.

## BLS/ALS

9. **Pain management** should be considered in the care of all patients. Ask patient to rate pain on a scale of 0-10.

10. If patient is experiencing nausea or vomiting, consider administering **ZOFRAN (ondansetron) ODT 4 mg tab or 4 mg slow IV x 1 dose only.**

11. Attempt to contact Medical Control as soon as care is completed or patient's condition is stabilized. Relay assessment and treatment information, including patient response to treatment.

   *Note: Some patients with time-sensitive illness or injury will benefit from limiting scene time AND early notification of Medical Control to mobilize hospital response teams. Contact Medical Control at the initial point of contact, as soon as a clinical impression has been formed from assessment findings.*

   *These patients include, but are not limited to, STEMI findings in suspected coronary artery chest pain, abnormal Cincinnati Prehospital Stroke Scale in stroke, cardiac arrest in pregnancy, and meeting trauma center bypass criteria in adult and pediatric trauma.*

12. Interpretation of ECG and vital signs q 15 minutes and after each ALS intervention; q 5 minutes if unstable.

13. Transport to the closest appropriate hospital. **Note: By law, a physician must certify that the benefits outweigh the risks of transport to a facility other than the closest appropriate hospital. Establish Medical Control contact before initiating transport. ECRN must contact and obtain the availability of the intended receiving hospital before authorizing the bypass.**

14. Pursuant to **Illinois Vehicle Code Section 625 ILCS 5/11-1421**, the use of visual and audible warning devices from the scene to the hospital is authorized by the EMS Medical Director when deemed necessary by the healthcare provider(s) caring for the patient (refer to System-specific policy).

**Certain situations may require that treatment, which would normally be administered on the scene, be attempted enroute to the hospital. The patient's condition or behavior which necessitated abbreviated scene time should be thoroughly documented.**
<table>

<tr>
<td>6. ETA</td>
</tr>
</tbody>
</table>
INITIATION OF ALS CARE

**ALS** should be initiated according to the following guidelines:

1. Patient with abnormal vital signs, regardless of complaints. The following are guidelines for adults:
   - Pulse < 60 or > 130 BPM; or irregularity
   - Respiratory rate < 10 or > 30; or irregularity
   - Systolic blood pressure < 90 or > 200 mmHg

2. Any patient with a potential life-threatening condition which exists or might develop during transport. Examples of situations in which ALS care is usually indicated include, but are not limited to:
   - Altered Mental Status and/or Unconsciousness
   - Chest Pain
   - Palpitations
   - Seizures
   - Neurologic Deficit/Stroke
   - Syncope or Near Syncope
   - Abdominal Pain
   - Shortness of Breath/Difficulty Breathing
   - Vaginal Bleeding
   - Complication of Pregnancy or Emergency Childbirth
   - GI Bleeding
   - Trauma
   - Overdose/Poisoning

3. In an uncooperative patient, the requirements to initiate assessment and full ALS service may be waived in favor of assuring that the patient is transported to an appropriate medical facility. Document clearly the reasons ALS care was aborted.

4. Never discontinue ALS once initiated unless prior approval by Medical Control.

5. **WHEN IN DOUBT, CONSULT WITH MEDICAL CONTROL.**

6. **Drug Administration Guidelines for Pediatric Patients:** When calculating drug dosages for pediatric patients, the maximum individual and total doses should not exceed the respective adult doses. This does not apply to IV fluid boluses (where the pediatric dose of 20 mL/kg may exceed the 200 mL adult dose) or individual doses of Versed (midazolam) or Narcan (naloxone) due to weight-based dosing.
LOAD-AND-GO SITUATIONS

This SOP applies if circumstances demand hospital care for patient stability. In certain circumstances, a patient's condition may require EMS providers to omit or abbreviate certain procedures described in these SOPs. The decision to deviate from Standard Operating Procedures must be documented thoroughly. This Standard Operating Procedure does not imply that the rate of speed of transport is accelerated, but rather, there is emphasis on rapid patient packaging and limited on-scene time (barring prolonged extrication). **Any deviation from Standard Operating Procedures must be based on the medical judgment of the EMS provider treating the patient.**
### WITHHOLDING OR WITHDRAWING OF RESUSCITATIVE EFFORTS

**BLS/ALS**
1. If at any time you are not certain which of these policies apply, begin treatment and contact Medical Control for orders.
2. Emotional support should be provided to significant others.
3. Disposition of the patient will be handled according to local and county requirements.
4. **Use of SOP must be guided by a physician.** Contact should be established via telemetry radio or cellular phone. Note: **MERCI radio or private phone may be used in extenuating circumstances.**
5. Patients may be pronounced dead by an ED physician. The time of pronouncement should be documented on the patient care report (PCR).

**ALS**
6. Document thoroughly all circumstances surrounding the use of this procedure.
7. Attach a copy of the ECG rhythm strip to the provider copy of the PCR. If someone represents themselves as having Power of Attorney to direct medical care of a patient and/or a document referred to as a Living Will is present, follow these guidelines:

**Power of Attorney for Healthcare**
8. POLST/DNR requests can only be honored by EMS providers if a **written POLST/DNR Order**, signed by the patient's Attending Practitioner, is presented.
9. Healthcare decisions other than POLST/DNR may be made by the Power of Attorney for Healthcare, if the document provides for this. If in doubt, begin treatment and contact Medical Control.
10. Bring any documents presented to the hospital.

**Living Will / Surrogates**
8. POLST/DNR requests can only be honored by EMS providers if a **written POLST/DNR Order**, signed by the patient's Attending Practitioner, is present.
9. Living Wills **may not** be honored by EMS providers. Begin or continue treatment. Contact Medical Control, explain the situation, and follow any orders received.
10. There are no situations in which a surrogate can directly give instructions to EMS providers. Begin or continue treatment. Contact Medical Control, explain the situation and follow any orders received.
WITHHOLDING OR WITHDRAWING OF RESUSCITATIVE EFFORTS

BLS/ALS
POLST / DNR Orders / Withholding Treatment

8. Confirm the validity of the POLST/DNR order according to System-specific policy. Call Medical Control if any item is missing. Components of a valid POLST/DNR order:
   - Must be a written document that has not been revoked. It must contain all of the following:
     - Name of patient
     - Resuscitation Orders (section A of the POLST form) or the equivalent language in a previous DNR form (the words “Do Not Resuscitate”, “Withhold Treatment”)
     - Three signatures required
     - Evidence of consent – any of the following:
       - Signature of the patient, or
       - Signature of Legal Guardian, or
       - Signature of Durable Power of Attorney for Health Care Agent, or
       - Signature of surrogate decision maker under the Illinois Health Care Surrogate Act
     - Signature of a Witness to Consent
     - Signature of Attending Practitioner - physician, licensed resident (second year or higher), advanced practice nurse or physician assistant
       - Effective date (date the practitioner signed the order)

9. If the POLST/DNR order is valid, resuscitative efforts will be withheld. Follow any specific orders found on the POLST/DNR order.

10. In the event the patient has a valid POLST/DNR order but IS NOT in cardiac or respiratory arrest with a decompensating condition, begin Adult Initial Medical Care SOP, p. 4-5; if you are considering intubation contact Medical Control. If unable to contact Medical Control, follow appropriate SOP.

11. If resuscitative efforts were begun prior to the POLST/DNR form being present, efforts may be withdrawn once the validity of the order is confirmed. Contact Medical Control and follow any orders received.
### WITHHOLDING OR WITHDRAWING OF RESUSCITATIVE EFFORTS

**BLS/ALS**

**Obviously Dead Patients: “Triple Zero”**

8. Obviously dead patients are those found to be non-breathing, pulseless, asystolic, and have one or more of the following long-term indications of death. No resuscitative efforts are to be initiated for the patients listed below:
   - Decapitation
   - Rigor Mortis without hypothermia
   - Profound dependent lividity
   - Decomposition
   - Mummification/putrefaction
   - Incineration
   - Frozen state

9. For patients appearing to be obviously dead but not listed above, contact Medical Control and explain the situation. Indicate that you have a “Triple Zero”. Follow any orders received.

10. Document pronouncement time and physician name.

**BLS/ALS**

**Hospice Patients Not in Arrest**

8. If patients are registered in a hospice program, initiate BLS care and immediately contact Medical Control for orders on treatment and disposition. Inform Medical Control of the presence of written treatment orders and/or valid POLST/DNR orders.
WITHOLDING OR WITHDRAWING OF RESUSCITATIVE EFFORTS

ALS
Patients in persistent Asystole / PEA who do not respond to treatment

Note: An order from a physician is required before stopping treatment under this SOP.

9. Contact Medical Control and explain the events of the call. Report treatments administered and any patient responses.
   - Confirm all of the following:
     - The patient is an adult, is normothermic, and experienced an arrest unwitnessed by EMS
     - The patient remains in asystole or PEA
     - Confirm **ADEQUATE AIRWAY** and **VASCULAR ACCESS**
     - Drug therapy, defibrillation, and CPR attempts have been carried out according to SOP
     - If available - waveform capnography under 10 mm for more than 20 minutes and/or duration of pulselessness
   - If the physician determines it is appropriate, s/he may give the order to discontinue medical treatment. It is not necessary that all four above criteria be met.
   - **Only an ED physician may make the determination to withdraw resuscitative efforts.**
   - Consult with Medical Control for disposition of patient. Record time of pronouncement and physician name.

10. If the physician gives the order to continue resuscitative efforts until you reach the hospital, treatment per appropriate SOP is to be carried out.
11. If unable to establish communications with Medical Control, resuscitative efforts should continue until the patient reaches the hospital.

BLS/ALS
Blunt Traumatic Arrest
   A. Blunt trauma patient without vital signs upon arrival, may consider withholding resuscitative efforts with approval of Medical Control.
ADULT SUSPECTED CARDIAC PATIENT WITH CHEST PAIN

STABLE: alert, oriented, normotensive

**BLS / ALS**

1. **Adult Initial Medical Care SOP, p. 4-5**
   - Inquire about the patient's use of sildenafil (Viagra), vardenafil (Levitra, Staxyn), tadalafil (Cialis, Adcirca), sildenafil citrate (Revatio) or riociguat (Adempas) within 36 hours. Administration of nitroglycerin (NTG) is contraindicated in these patients.
   - Inquire about the patient’s taking of Brilinta (ticagrelor). Contact Medical Control prior to administration of baby aspirin.
   - Hyperoxia should be avoided

2. Administer **baby aspirin 324 mg** (4 x 81 mg tablets) chewed and swallowed
   - unless contraindicated
   - may omit if patient has taken aspirin within 8 hours
   - administer aspirin to achieve a total dose of 324 mg within the last 8 hours

3. **12-Lead ECG** (if able). Obtain and review early, preferably with initial vital signs and before NTG administration.
   - If ST-segment elevation indicative of acute myocardial infarction (STEMI) seen, condition is considered **TIME-SENSITIVE. Contact Medical Control at the initial point of contact, as soon as a clinical impression has been formed from assessment findings.** Communicate ECG to Medical Control ASAP; transmit ECG (if System mandated) and/or relay ST-segment findings and machine interpretation.
   - If inferior wall pattern seen (ST-segment elevation in leads II, III and aVF), NTG is contraindicated
   - Maintain continuous ECG monitoring
   - Transport to the closest, most appropriate facility

**BLS**

4. If patient has physician-prescribed NTG and has not taken the maximum dose, and if SBP > 100 mmHg, administer **NTG 0.4 mg SL**

**ALS**

4. Systolic BP > 100 mmHg and symptomatic: **NTG 0.4 mg SL**; may repeat NTG x 1 in 5 minutes if systolic BP > 100 mmHg and IV established (NOTE: Initial NTG may be given prior to IV start)

5. If systolic BP > 100 mmHg, administer **FENTANYL 1 mcg/kg SLOW IV OR IM/IO/IN**, max first dose 100 mcg. Repeat dose 0.5 mcg/kg SLOW IV OR IM/IO/IN in 5 min, max repeat dose 50 mcg.
   Patients > 65 years old and if systolic BP > 100 mmHg, administer **FENTANYL 0.5 mcg/kg SLOW IV OR IM/IO/IN**, max dose 50 mcg. Repeat dose 0.25 mcg/kg SLOW IV OR IM/IO/IN in 5 min, max repeat dose 25 mcg.

**Supraventricular Bradycardia, Second Degree Type I AV block**

2. **ATROPINE 0.5 mg rapid IV/IO**; may **repeat ATROPINE** q 3-5 minutes up to 3 mg until pacing available.

3. If patient remains hypotensive and pulse < 60 BPM: initiate **TRANSCUTANEOUS PACING (TCP)** at an initial rate of 70 BPM per System-specific procedure. Consider sedation with **VERSED** (midazolam) **2 mg increments IV/IO** q 2 minutes up to 10 mg total as necessary.

4. If patient remains symptomatic, administer **DOPAMINE 5 – 10 mcg/kg/min IVPB**.

**IVR, Second Degree Type II or Third Degree AV block**

2. Initiate **TRANSCUTANEOUS PACING (TCP)** at an initial rate of 70 BPM per System-specific procedure. Consider sedation with **VERSED** (midazolam) **2 mg increments IV/IO** q 2 minutes up to 10 mg total as necessary.

3. If patient remains symptomatic, administer **DOPAMINE 5 – 10 mcg/kg/min IVPB**.

**Note:**
- If patient is symptomatic, **do not delay pacing** while awaiting IV access or atropine to take effect
- **Do not** give lidocaine to patients in AV blocks or IVR
- If ST-elevation in leads II, III, aVF (possible inferior wall MI), avoid lidocaine and nitroglycerin

## STABLE: alert, oriented, normotensive
2. Adult Initial Medical Care SOP, p. 4-5 - start IV in proximal vein
3. Valsalva maneuver while preparing medication
4. If no response, ADENOSINE 6 mg rapid IV with 10 mL NS flush
5. If no response, ADENOSINE 12 mg rapid IV with 10 mL NS flush
6. If no response, ADENOSINE 12 mg rapid IV with 10 mL NS flush

## UNSTABLE: HR > 150 BPM with altered mental status and/or signs of hypoperfusion
2. Adult Initial Medical Care SOP, p. 4-5
3. Consider sedation with VERSED (midazolam) 2 mg increments IV/IO q 2 minutes up to 10 mg total as necessary.
4. SYNCHRONIZED CARDIOVERSION at 100 J
5. If no response, repeat SYNCHRONIZED CARDIOVERSION at recommended energy. Check rhythm and pulse between shocks.
6. If no response, consider CARDIOGENIC SHOCK SOP, p. 23, or contact Medical Control

## ADENOSINE Notes:
- ADENOSINE should not be given to irregular rapid rhythms
- Follow ADENOSINE doses with rapid 10 mL NS flush

For defibrillation / cardioversion energy settings, please refer to DEFIBRILLATION & CARDIOVERSION ENERGIES, p. 124
# ADULT VENTRICULAR TACHYCARDIA WITH PULSE (WIDE COMPLEX TACHYCARDIA)

## ALS

### STABLE: alert, oriented, normotensive

1. **Adult Initial Medical Care SOP, p. 4-5, with HIGH FiO₂**
2. Treat patient with either amiodarone (preferred) OR lidocaine only. Do not combine medicinal therapies.

<table>
<thead>
<tr>
<th>Amiodarone (Preferred)</th>

</tr>
</tbody>
</table>

**Note:**
- If VT becomes pulseless or deteriorates to ventricular fibrillation (VF), defibrillate immediately per **VENTRICULAR FIBRILLATION / PULSELESS VENTRICULAR TACHYCARDIA SOP**, p. 19

For defibrillation / cardioversion energy settings, please refer to **DEFIBRILLATION & CARDIOVERSION ENERGIES**, p. 124
# ADULT VENTRICULAR FIBRILLATION (VF)
## ADULT PULSELESS VENTRICULAR TACHYCARDIA (pVT)

### ALS
1. Verify pulselessness
2. If arrest is witnessed by EMS providers, **DEFIBRILLATE** as soon as available. If defibrillator is not immediately available, perform **precardial thump**
3. **High Quality Continuous CPR** until defibrillator available
   - While patient is pulseless, CPR should be continuous except for pausing for ventilation (unless intubated), rhythm check or shock delivery. Rhythm checks should be less than 10 seconds and pulse checks only if an organized rhythm is observed
4. **DEFIBRILLATE** at recommended initial energy
5. Resume CPR immediately following defibrillation. After 2 minutes, pause CPR and check rhythm and pulse
   - If VF/pulseless VT, **resume CPR** and **DEFIBRILLATE** at second recommended energy as soon as defibrillator charged
   - If rhythm converted after defibrillation, treat per appropriate SOP
6. If pulseless, resume CPR. **INTUBATE. Establish IV/IO ACCESS.**
7. Treat patient with either amiodarone (preferred) **OR** lidocaine **only. Do not combine therapies.**

### Amiodarone (Preferred)
8. **EPINEPHRINE 1:10,000 1 mg IV/IO.** After 2 minutes of CPR, **DEFIBRILLATE** at maximum energy.
9. **AMIODARONE 300 mg IV.** After 2 minutes of CPR, **DEFIBRILLATE** at maximum energy.
10. **EPINEPHRINE 1:10,000 1 mg IV/IO.** After 2 minutes of CPR, **DEFIBRILLATE** at maximum energy.
11. **AMIODARONE 150 mg IV as repeat dose.** After 2 minutes of CPR, **DEFIBRILLATE** at maximum energy.
12. Repeat **EPINEPHRINE / CPR / DEFIBRILLATION** sequence q 2-3 minutes as long as pulseless rhythm persists.

### Lidocaine
8. **EPINEPHRINE 1:10,000 1 mg IV/IO.** After 2 minutes of CPR, **DEFIBRILLATE** at maximum energy.
9. **LIDOCAINE 1 mg/kg IV/IO.** After 2 minutes of CPR, **DEFIBRILLATE** at maximum energy.
10. **EPINEPHRINE 1:10,000 1 mg IV/IO.** After 2 minutes of CPR, **DEFIBRILLATE** at maximum energy.
11. Repeat **LIDOCAINE / CPR / DEFIBRILLATION** sequence q 2-3 minutes up to 3 mg/kg.
12. Repeat **EPINEPHRINE / CPR / DEFIBRILLATION** sequence q 2-3 minutes as long as pulseless rhythm persists.
For patients treated with LIDOCAINE ONLY

If VF converts to a supraventricular rhythm, bolus LIDOCAINE 1 mg/kg IV/IO, and rebolus LIDOCAINE 0.5 mg/kg after 10 minutes if not contraindicated to a maximum dose of 3 mg/kg.

Note:
- Flush all IV/IO push meds with 20 mL IV fluid
- Defibrillation sequence is CPR – Rhythm Check – CPR (defibrillator charging or medication administration) – Shock

For defibrillation / cardioversion energy settings, please refer to DEFIBRILLATION & CARDIOVERSION ENERGIES, p. 124
## ADULT ASYSTOLE / PULSELESS ELECTRICAL ACTIVITY

### ALS

1. **High Quality Continuous CPR** until defibrillator available for rhythm check
   - While patient is pulseless, CPR should be continuous except for pausing for ventilation (unless intubated), or rhythm check. Rhythm checks should be less than 10 seconds and pulse checks only if an organized rhythm is observed
   - Search for potentially reversible causes:

<table>
<thead>
<tr>

</tbody>
</table>

2. Administer **EPINEPHRINE 1:10,000 1 mg IV/IO**
   - Repeat **EPINEPHRINE** q 3 minutes while pulseless

3. If pulse returns, refer to appropriate SOP

4. If patient remains in persistent asystole, consider withdrawal of resuscitation per **WITHDRAWING OF RESUSCITATIVE EFFORTS SOP, p. 12**

### Notes:

- Flush all IV/IO push meds with 20 mL IV fluid
# ADULT PULMONARY EDEMA (DUE TO HEART FAILURE)

## BLS/ALS

**STABLE:** alert, oriented, normotensive or hypertensive

1. **Adult Initial Medical Care SOP, p. 4-5**
   - Place patient in High Fowler’s position, if systolic BP > 100 mmHg
   - Consider need and method of delivery of supplemental oxygen

2. If systolic BP > 100 mmHg, administer **NTG 0.4 mg SL**

## ALS

**STABLE:** alert, oriented, normotensive or hypertensive

3. Administer **NIPPV / CPAP,** if available, per System-specific procedure. If patient becomes unstable, remove **NIPPV / CPAP** and treat per appropriate SOP

**NIPPV / CPAP Inclusion Criteria:**
- Respiratory Distress – 2 or more of the following:
  - Retractions/accessory muscle use
  - Respiratory rate > 25
  - SPO\(_2\) < 90%
  - Exam consistent with pulmonary edema
  - Bilateral or diffuse rales/crackles

4. If systolic BP > 100 mmHg, repeat **NTG 0.4 mg SL**; may repeat q five minutes if systolic BP > 100 mmHg

## UNSTABLE: altered mental status or signs of hypoperfusion

1. **Adult Initial Medical Care SOP, p. 4-5. HIGH FiO\(_2\) or VENTILATION**

2. Pulse < 60 BPM: treat per **BRADYDYSRHYTHMIAS SOP, p. 15**
   - Pulse ≥ 60 BPM: treat per **CARDIOGENIC SHOCK SOP, p. 23**

**Note:**
- Oral medications for erectile dysfunction (Viagra, Levitra, Cialis, Adcirca, Staxyn, sildenafil, tadalafil, vardenafil) or pulmonary hypertension (Revatio, Adempas, sildenafil, riociguat) may potentiate the effect of nitrates
- **Consult Medical Control** prior to administering NTG in these situations.
ADULT CARDIOGENIC SHOCK

ALS
1. Adult Initial Medical Care SOP, p. 4-5, with HIGH FiO₂ or VENTILATION
   - If hypovolemic and/or dehydrated and lungs are clear:
     IV FLUID BOLUS IN 200 mL INCREMENTS x 2
   - Reassess breath sounds after each 200 mL increment IV fluid bolus

2. Treat underlying dysrhythmias per appropriate SOP

3. DOPAMINE DRIP, dose dependent on clinical condition
   - If pulse > 60 BPM, begin at 5 mcg/kg/min and increase q 3 min to achieve systolic BP ≥ 90 mmHg to a maximum of 20 mcg/kg/min

**Calculation Chart**

Individual dosage requirements may vary widely.
The above drip rates cover a dosage range of 5 – 20 mcg/kg/min.
This chart applies to a concentration of 1600 mcg/mL
(typically 800 mg/500 mL or 400 mg/250 mL D5W).
ADULT AIRWAY OBSTRUCTION

BLS/ALS
1. Determine responsiveness and ability to speak
2. Position patient to open airway:
   • If unconscious: use head tilt/chin lift
   • If suspected cervical spine injury: use modified jaw thrust
3. Assess breathlessness/degree of airway impairment
4. Monitor for:
   • Cardiac dysrhythmias and/or arrest

CONSCIOUS
ABLE TO SPEAK:
5. Complete Adult Initial Medical Care SOP, p. 4-5:
   • Do not interfere with patient's own attempts to clear airway

CANNOT SPEAK:
5. 5 abdominal thrusts with patient standing or sitting
   5 chest thrusts if patient in 2nd – 3rd trimester of pregnancy or morbidly obese
   Repeat if no response
6. If successful: complete Adult Initial Medical Care SOP, p. 4-5, and transport
7. Still obstructed:
   While enroute to the hospital, continue any of the above steps you are reasonably able to perform.

UNCONSCIOUS
Note: Any time the efforts to clear the airway are successful, complete Adult Initial Medical Care SOP, p. 4-5, and transport.
5. Attempt to ventilate. If obstructed:
   • Attempt to clear away in the presence of visible airway obstruction unless contraindicated
   • Consider suction
   If still obstructed and unconscious, repeat above steps until airway is clear

ALS
6. Visualize airway with laryngoscope and attempt to clear using Magill forceps and/or suction.
7. Still obstructed: Attempt forced ventilation
8. Still obstructed: INTUBATE and attempt to push foreign body into right main stem bronchus, then pull tube back and ventilate left lung
9. Still obstructed: Perform CRICOTHYROIDOTOMY; HIGH FiO2 VENTILATION and transport
ADULT DRUG ASSISTED INTUBATION - ETOMIDATE

1. **ALS**
2. This SOP is to be used for patients > 15 years of age. **If ≤ 15 years of age, see PEDIATRIC DRUG ASSISTED INTUBATION - VERSED SOP, p. 85.**

3. **Adult Initial Medical Care SOP, p. 4-5** - The following are situations which may require the use of this SOP to facilitate intubation:
   - Glasgow Coma Scale score of ≤ 8
   - Imminent respiratory arrest
   - Imminent tracheal/laryngeal closure due to severe edema secondary to trauma or anaphylaxis
   - Flail chest and/or open chest wounds with cyanosis and a respiratory rate < 10 or > 30

**ALWAYS HAVE CRICOTHYROIDOTOMY EQUIPMENT AVAILABLE**

4. Prepare patient and equipment for procedure:
   - Position patient in sniffing position unless cervical spine injury suspected
   - Have suction with Yankauer or other rigid tip ready
   - Prepare all intubation and cricothyroidotomy equipment per System-specific procedure
   - **HIGH FiO₂ VENTILATION** prior to and in-between steps of this procedure as able

5. **BENZOCAINE spray** to posterior pharynx (0.5-1 second spray x 2, 30 seconds apart)
6. Administer **ETOMIDATE 0.6 mg/kg IV/IO, max dose 40 mg**
7. Attempt oral or oral in-line intubation via System-specific procedure
8. After passing of tube, verify placement:
   - Adequate chest expansion bilaterally and symmetrically
   - Positive bilateral breath sounds
   - Negative epigastric sounds
   - Waveform capnography, end tidal CO₂ detector and/or esophageal detection device per System-specific procedure
9. Secure ET tube and reassess placement

**POST INTUBATION SEDATION**
10. Administer **VERSED** (midazolam) 2 mg increments IV/IO q 2 minutes up to 10 mg total as necessary

If unsuccessful, continue **HIGH FiO₂ VENTILATION**, contact Medical Control, and be prepared for **CRICOTHYROIDOTOMY** per System-specific procedure.
USE OF AUTOMATIC TRANSPORT VENTILATORS (ATV)  
(OPTIONAL EQUIPMENT)

**ALS**

**Indications for ATV use:** Intubated adult apneic / non-traumatic cardiopulmonary arrest patients that require ventilator support. Medical control must approve use on pediatric patients.

Contraindications for ATV use:
- patients with suspected pneumothorax or tension pneumothorax
- traumatic arrest patients

Required equipment:
- approved ATV connected to oxygen source
- tools for intubation including method(s) of verifying tube placement

**ATV procedure**

1. Establish definitive airway
2. Assemble components of ATV and ensure proper working order
3. Determine proper tidal volume and respiratory rate using the following guidelines:
   - tidal volume: 10 mL/kg – when in doubt, round down
   - rate:  8-10 per minute (may increase to 12-20 per minute if perfusing rhythm returns)
4. Remove BVM and connect ATV to endotracheal tube. Continually assess for proper functioning of the ATV and return of spontaneous respirations.
5. If the patient should begin spontaneous respirations, stop the use of the ATV and assist ventilations with BVM.

**Special Information:**
- Specific ATVs are to receive System approval prior to their use.
- Providers using this equipment must follow the manufacturer's guidelines regarding the use, maintenance, cleaning and regular testing of the device.
- During patient care, providers shall chart the initial settings, and any subsequent changes on the patient care report.
- Specific ATV training programs are to be submitted and to receive approval from the respective EMS System. Initial annual training shall be documented.
- This is an optional piece of equipment. The purchase and maintenance is the responsibility of the provider. All ATVs shall be lightweight and rugged in design, capable of operating under common environmental conditions and extremes of temperature.
ADULT ACUTE ASTHMA
COPD WITH WHEEZING
REACTIVE (LOWER) AIRWAY DISEASE

BLS
1. Adult Initial Medical Care SOP, p. 4-5
2. If patient has prescribed inhaler, obtain time of last usage. If appropriate, assist patient with prescribed inhaler.
3. Reassess patient's respiratory status and begin transport
4. At discretion of Medical Control, additional doses of inhaler may be given
5. ALBUTEROL 2.5 mg (3 mL) via nebulizer per System-specific procedure
6. Consider possibility of congestive heart failure (CHF) / pulmonary edema in wheezing patient, if patient has a history of CHF, and/or pulmonary edema. If so, treat per PULMONARY EDEMA SOP, p. 22.

ALS
1. Adult Initial Medical Care SOP, p. 4-5
2. ALBUTEROL 2.5 mg (3 mL) via nebulizer
3. Partial response: repeat ALBUTEROL immediately
4. If no response to ALBUTEROL or patient in severe respiratory distress:
   • consider NIPPV / CPAP per System-specific procedure
   • If age ≤ 50 and patient has no history of cardiac disease, consider EPINEPHRINE 1:1000 0.3 mg IM
     ♦ If age > 50 and/or cardiac disease history, contact Medical Control
5. If imminent respiratory arrest, INTUBATE and use in-line ALBUTEROL 2.5 mg (3 mL)
### ADULT PARTIAL (UPPER) AIRWAY OBSTRUCTION / EPIGLOTTITIS

**ALS/BLS**
1. Adult Initial Medical Care SOP, p. 4-5
2. Prepare intubation / cricothyroidotomy / suction equipment

**ALS**

**STABLE** - No cyanosis, effective air exchange
3. NORMAL SALINE 6 mL via nebulizer
4. If wheezing: **ALBUTEROL 2.5 mg (3 mL) via nebulizer.** Do not delay transport waiting for a response.

**UNSTABLE** - Cyanosis, marked stridor or respiratory distress, severely diminished or absent breath sounds, evidence of inadequate air exchange, bradycardic, altered mental status, retractions, ineffective air exchange, actual or impending respiratory arrest

**Breathing:**
3. **EPINEPHRINE 1:1000 3 mg (3 mL) via nebulizer**

**Nonbreathing:**
3. **HIGH FiO₂ VENTILATION**
   - Attempt **ENDOTRACHEAL INTUBATION x 1** if unable to ventilate
   - If intubation unsuccessful, perform **CRICOTHYROIDOTOMY** per System-specific procedure
# ADULT ALLERGIC REACTION / ANAPHYLAXIS

## BLS/ALS
1. Adult Initial Medical Care SOP, p. 4-5
2. Apply ice/cold pack to site
3. BLS: at the direction of Medical Control, administer one dose **EPINEPHRINE** autoinjector (EpiPen®)

## ALS

Allergic reaction with systemic signs, i.e. wheezing, diffuse hives, or prior history of systemic reaction, *without signs of hypoperfusion*

4. Administer **BENADRYL** (diphenhydramine) 50 mg IM or slow IV/IO. Max dose 50 mg.
5. Administer **EPINEPHRINE 1:1000 0.3 mg IM**. May repeat x 1 after 15 minutes if minimal response
   - If age > 50 years old and/or cardiac disease history, contact Medical Control prior to administration of **EPINEPHRINE**
6. If wheezing, consider **ALBUTEROL 2.5 mg (3 mL) via nebulizer**

## ALS

Anaphylaxis: multisystem reaction with signs of hypoperfusion; altered mental status or severe respiratory distress/wheezing/hypoxia

1. If signs of hypoperfusion, **IV/IO FLUID BOLUS in 200 mL increments**
   - Administer **EPINEPHRINE 1:10,000 0.5 mg slow IV/IO** or **EPINEPHRINE 1:1000 0.5 mg IM**. May repeat **EPINEPHRINE q 3 minutes**
2. Administer **BENADRYL** (diphenhydramine) 50 mg slow IV/IO
   - If no IV, give **BENADRYL** (diphenhydramine) 50 mg IM
   - No repeat dose
3. If wheezing, consider **ALBUTEROL 2.5 mg (3 mL) via nebulizer**
4. Consider **DOPAMINE** per **CARDIOGENIC SHOCK SOP, p. 23**, for refractory hypotension

## Note
- **EPINEPHRINE** may be given IM if IV/IO access delayed.
# ADULT DIABETIC / GLUCOSE EMERGENCIES

<table>
<thead>
<tr>
<th>BLS/ALS</th>

<tr>
<td>4. Administer DEXTROSE 50% 25 g (50 mL) IV. If partial or no improvement, repeat DEXTROSE 50% 25 g (50 mL) IV after 5 minutes</td>
</tr>
</tbody>
</table>

**OR**

During critical drug shortages of dextrose 50%, administer **DEXTROSE 10% 12.5 g (125 mL) IV**.

| 5. If unable to start IV, administer **GLUCAGON 1 mg IM** |

| Blood sugar > 180 with signs and symptoms of hyperglycemia/ketoacidosis |
| 4. **IV FLUID BOLUS** in consecutive 200 mL increments, unless contraindicated |
ADULT SYNCOPE / NEAR SYNCOPE  
Non-traumatic loss of consciousness

**BLS/ALS**

1. Adult Initial Medical Care SOP, p. 4-5  
2. Obtain and record blood glucose level. If < 60, treat per ADULT DIABETIC / GLUCOSE EMERGENCIES, p. 30  
3. Anticipate underlying etiologies and treat according to appropriate SOP:
   - Metabolic: ADULT DIABETIC / GLUCOSE EMERGENCIES, p. 30, or TOXICOLOGIC EMERGENCIES SOP, p. 35-37
   - Cardiac: Appropriate Cardiac SOP, P. 13-23
   - Hypovolemic: Fluid resuscitation
   - CNS Disorder: See appropriate Medical or Trauma SOP
   - Vasovagal: Adult Initial Medical Care SOP, p. 4-5

If indicated by decreasing sensorium and pinpoint pupils, depressed respirations, and possible history of opioid/synthetic opioid ingestion:

4. Consider:
   - **BLS**  
     NARCAN (naloxone) 2 mg IN
   - **ALS**  
     NARCAN (naloxone) 1 mg IV/IN, repeat dose 0.5 mg IV/IN q 2 minutes up to max dose 2 mg if transient response observed

**BLS**

5. Expeditious transport. Contact Medical Control enroute

**ALS**

**STABLE:** alert, oriented, normotensive
   - Special considerations:
     - Monitor ECG continually enroute
     - Consider 12-lead ECG
     - Document changes in GCS

**UNSTABLE:** altered mental status or signs of hypoperfusion

If lungs clear with hypoperfusion:

5. **IV FLUID BOLUS** in 200 mL increments
ADULT SEIZURES / STATUS EPILEPTICUS
Non-traumatic origin

**BLS/ALS**
1. Adult Initial Medical Care SOP, p. 4-5; special considerations:
   - Clear and protect airway. Vomiting/aspiration precautions.
   - Protect the patient from injury. Do not place anything in mouth if seizing.
   - Position patient on side unless contraindicated
2. Obtain and record blood glucose level, if available. If < 60 treat per ADULT DIABETIC / GLUCOSE EMERGENCIES, p. 30

**ALS**
If actively seizing:
3. Administer **VERSED** (midazolam) 2 mg slow IV increments q 2 minutes up to 10 mg total as necessary.
4. If unable to start IV:
   - Administer **VERSED** (midazolam) 10 mg in 2 mL IN
   - Or
   - Administer **VERSED** (midazolam) IM
     - < 70 kg = 5 mg IM
     - ≥ 70 kg = 10 mg IM

**Note:** If suspected that seizure is secondary to opioid overdose, see ADULT TOXICOLOGIC EMERGENCIES SOP, p. 35
ADULT STROKE

**BLS/ALS**
1. Adult Initial Medical Care SOP, p. 4-5
   - Limit scene time
   - **Contact Medical Control at the initial point of contact, as soon as a clinical impression has been formed from assessment findings.**
   - **Spinal Motion Restriction** for unconscious patient with suspected trauma
   - Obtain and record time when last at baseline / **Last Known Well**
   - Obtain and record blood glucose level. If < 60, treat per **ADULT DIABETIC / GLUCOSE EMERGENCIES, p. 30**

2. Protect airway, suction as necessary.
3. Maintain head and neck in neutral alignment. DO NOT flex neck. If systolic BP > 90 mmHg, elevate head of bed 15-30°.
4. Assess and record neurological status using GCS and note any changes.
5. Assess patient using the Cincinnati Prehospital Stroke Scale (CPSS) and document new findings:
   - New Facial Droop (have patient show teeth or smile)
   - New Arm Drift (patient closes eyes and hold both arms out)
   - New Speech Deficit (have patient say “You can't teach an old dog new tricks”)
6. If the patient has an abnormal Cincinnati Prehospital Stroke Scale they should be transported to the closest Primary Stroke Center (PSC).
7. Transport patients with an unobtainable or normal Cincinnati Prehospital Stroke Scale with any of the following symptoms to the closest PSC:
   - New onset of sudden or persistent language deficiency
   - New onset of sudden unilateral numbness or weakness
   - New onset of severe sudden headache with vomiting with or without severe hypertension (systolic BP > 200 mmHg)
   - New onset of sudden and persistent alteration of mental status
   - New onset of severe and sudden loss of balance/new onset ataxia
   - New onset of sudden visual field loss in one or both eyes

**ALS**
Consider **12-lead ECG**
1. **INTUBATE** if GCS score ≤ 8
2. Establish IV, limit IV attempts to 2
3. If seizure activity, refer to **ADULT SEIZURES / STATUS EPILEPTICUS, p. 32**
4. Call Medical Control early and communicate time when patient was last at baseline/**Last Known Well** (if known)
5. Transport to the closest Primary Stroke Center for continuation of stroke care
ADULT ACUTE ABDOMINAL PAIN

BLS/ALS

1. Adult Initial Medical Care SOP, p. 4-5

ALS

2. Consider pain management:
   - If systolic BP > 100 mmHg, administer FENTANYL 1 mcg/kg SLOW IV OR IM/IO/IN, max first dose 100 mcg. Repeat dose 0.5 mcg/kg SLOW IV OR IM/IO/IN in 5 min, max repeat dose 50 mcg.
   - Patients > 65 years old and if systolic BP > 100 mmHg, administer FENTANYL 0.5 mcg/kg SLOW IV OR IM/IO/IN, max dose 50 mcg. Repeat dose 0.25 mcg/kg SLOW IV OR IM/IO/IN in 5 min, max repeat dose 25 mcg.

3. If patient is experiencing nausea or vomiting, consider administering ZOFRAN (ondansetron) ODT 4 mg tab or 4 mg slow IV x 1 dose only.

UNSTABLE: altered mental status and/or signs of hypoperfusion

4. Establish large bore IV enroute. Administer IV FLUID BOLUS of 200 mL, repeat as necessary. Titrate infusion rate based on clinical presentation.

5. If suspected abdominal aortic aneurysm or ectopic pregnancy, early aggressive fluid resuscitation should be considered.

6. If signs and symptoms of shock present, establish second IV.
# ADULT TOXICOLOGIC EMERGENCIES

## BLS/ALS

### STABLE: alert, oriented, normotensive

1. **Adult Initial Medical Care SOP, p. 4-5**
   - HazMat precautions

For known or suspected OPIOID OVERDOSE with GCS score ≤ 8:

2. Protect airway, **HIGH FiO**₂ or VENTILATION

3. Consider:
   - **BLS**
     - **NARCAN (naloxone) 2 mg IN**
   - **ALS**
     - **NARCAN (naloxone) 1 mg IV/IN,**
       - repeat dose 0.5 mg IV/IN q 2 minutes
       - up to max dose 2 mg if transient response observed before intubation if airway is able to be controlled and ventilations are effective

## ALS

### UNSTABLE: altered mental status, airway compromise, and/or hypoperfusion

1. **Adult Initial Medical Care SOP, p. 4-5**
   - HazMat precautions
2. GCS score ≤ 8 and evidence of airway compromise, **INTUBATE.** The use of Alternate Airway is contraindicated in ingestion of caustic substance.
3. Unknown etiology with respiratory compromise:
   - **Administer NARCAN (naloxone) 1 mg IV/IN.** Repeat dose 0.5 mg IV/IN PRN q 2 minutes up to max dose 2 mg if transient response observed

### CYCLIC ANTIDEPRESSANT / SODIUM CHANNEL BLOCKER OVERDOSE

- **Hypoperfusion** associated with wide QRS complex (possible cyclic ingestion)

4. Administer **NORMAL SALINE 1 L IV bolus**
5. Administer **SODIUM BICARBONATE 8.4% 1 mEq/kg IV**

### BETA-BLOCKER / CALCIUM CHANNEL BLOCKER OVERDOSE

- **Hypoperfusion** associated with bradycardia (possible beta blocker or calcium channel blocker ingestion)

4. Administer **GLUCAGON 1 mg slow IV.** May repeat x 1.
5. If no response consider transcutaneous pacing (TCP).
ADULT TOXICOLOGIC EMERGENCIES

MUSCARINIC POISONING - excessive body secretions

D – Diarrhea  OR  Salivation (excessive production of saliva)
U – Urination  OR  Laceration (excessive tearing)
M – Miosis  OR  Urination (uncontrolled urine production)
B – Bronchorrhea / Bronchospasm  OR  Defecation (uncontrolled bowel movement)
B – Bradycardia  OR  Gastrointestinal distress (cramps)
E – Emesis  OR  Eructation (excessive vomiting)
L – Lacrimation  OR  Breathing Difficulty
S – Salivation  OR  Miosis (pinpoint pupils)

4. Administer ATROPINE 2 mg rapid IV/IO
   Repeat q 3 minutes until condition improves (no dose limit)

CYANIDE POISONING

Signs of Cyanide Poisoning
- Altered Mental Status
- Confusion, Disoriented
- Tachypnea/Hyperpnea (early)
- Bradypnea/Apnea (late)
- Seizures or Coma
- Mydriasis (dilated pupils)
- Hypertension (early) / Hypotension (late)
- Cardiovascular collapse
- Vomiting

Symptoms of Cyanide Poisoning
- Headache
- Confusion
- Dyspnea
- Chest Tightness
- Nausea

4. Initial Medical Care, considerations:
- Consider NIPPV / CPAP, per System-specific procedure
- Consider ADVANCED AIRWAY if the patient has GCS ≤ 8, inhalation burns, bradypnea or tachypnea, hoarse voice and/or impending airway closure.
- Consider 12-LEAD ECG

5. If signs and symptoms consistent with cyanide poisoning and if available, administer hydroxocobalamin (Cyanokit®) per dosing schedule p. 38

6. If hypotensive or pulseless, NORMAL SALINE 1 L IV bolus. If pulseless, refer to appropriate cardiac arrest SOP.

CARBON MONOXIDE POISONING

4. HIGH FiO₂ or VENTILATION
- Consider cyanide poisoning
- Do not rely on pulse oximetry
- Keep patient as quiet as possible to minimize tissue oxygen demand

SUSPECTED CLUB DRUG OVERDOSE

4. Contact Medical Control for suspected use of club drugs
Drugs Commonly Seen in Overdose / Poisoning

Opioids
Morphine, Demerol (meperidine), heroin, methadone, codeine, Duragesic (fentanyl), Vicodin/Lortab (APAP and hydrocodone), hydrocodone, Dilaudid (hydromorphone), Percocet (oxycodone and APAP), OxyContin (oxycodone)

Sodium Channel Blockers
Benadryl (diphenhydramine), Dilantin (phenytoin)

Cyclic Antidepressants
Elavil (amitriptyline), Norpramin (desipramine), Tofranil (imipramine), Pamelor (nortriptyline), Sinequan (doxepine)

Benzodiazepines
Halcion (triazolam), Ativan (lorazepam), Restoril (temazepam), Versed (midazolam), Valium (diazepam), Xanax (alprazolam), Librium (chlordiazepoxide), Klonopin (conlazepam), Dalmane (flurazepam), Rohypnol (flunitrazepam), Ambien (zolipdem)

Beta Blockers:
Inderal (propranolol), Corgard (nadolol), Lopressor (metoprolol), Tenormin (atenolol), timolol

Calcium Channel Blockers:
Cardizem (diltiazem), Procardia (nifedipine), Calan/Adalat/Isoptin (verapamil), Norvasc (amlodipine)

Club Drugs
GHB (Liquid G, Liquid Ecstasy), ketamine (Special K, Vitamin K, Super K), MDMA (Ecstasy, XTC, ADAM, E), Foxy Methoxy, AMT, Coricidin (Triple-C)

Poison Control Center 1-800-222-1222
HYDROXOCOBALAMIN (CYANOKIT®) ADMINISTRATION (if available)

**Scene Size-up**
Scene Safety – If necessary, mitigate any hazardous materials and/or chemicals that may impair, or pose a danger to, the rescuer prior to treatment.

**ALS**
1. Adult Initial Medical Care SOP, p. 4-5
   - Consider need for ADVANCED AIRWAY if patient has GCS ≤ 8, inhalation burns, bradypnea / tachypnea, hoarse voice and/or signs of impending airway closure
   - Consider 12-lead ECG
2. If signs and symptoms consistent with cyanide poisoning, administer HYDROXOCOBALAMIN (CYANOKIT® packaged as 2.5 g in 100 mL, concentration of 25 mg/mL)
   - Adult - 5 g over 15 min (15 mL/min)
   - Pediatric - 70 mg/kg over 15 min, not to exceed 5 g
3. Contact Medical Control, transport and monitor patient

**Special Considerations:** Hydroxocobalamin (Cyanokit®) requires its own dedicated IV line. Do not use existing IV line for administration. Do not piggyback

**Signs of Cyanide Poisoning**
- Altered Mental Status
- Confused, Disoriented
- Tachypnea / Hypernea (early)
- Bradypnea / Apnea (late)
- Seizures / Coma
- Mydriasis (dilated pupils)
- Hypertension (early)
- Hypotension (late)
- Cardiovascular Collapse
- Vomiting

**Symptoms of Cyanide Poisoning**
- Headache
- Confusion
- Dyspnea
- Chest Tightness
- Nausea
**SNAKEBITE / ENVENOMATION**

**BLS/ALS**

**Scene Size-Up**
- Assess scene and personal safety
- Use standard precautions on all patients

1. **Adult Initial Medical Care SOP, p. 4-5**
   - Confirm adequate airway
   - **High FiO2**
   - Check pulse and control hemorrhage as indicated
   - Assess AVPU and monitor neurological status
   - Apply sterile gauze dressing over wound
   - Remove all jewelry and/or constrictive clothing
   - **Special Considerations:**
     - Allow patient to lie flat and avoid as much movement as possible. Keep patient calm. Allow the bitten limb to rest at level of the patient's heart.
     - Medical Control should be contacted immediately whenever snakebite is suspected.
       i. Notify Medical Control if antivenin is available at the scene.
       ii. Request that Medical Control contact toxicologist / Poison Control Center ASAP at 1-800-222-1222
   - Notify Medical Control of type of snake. If safe to do so, obtain photo of snake for identification.
   - If compression wrap has been applied by special services staff (e.g. animal control or zoological park), do not remove.
   - DO NOT apply ice, heat, tourniquet or incise wound.

**ALS**
- Observe for respiratory compromise. Provide intervention, if necessary, per appropriate SOP.
- Evaluate cardiac rhythm. Treat dysrhythmias per appropriate SOP.
- Establish two large bore IVs of normal saline in unaffected extremity.
- Use direct pressure to control hemorrhage if present. Avoid elevation of extremities.
- Reassess frequently for mental status changes.

**Note:** If transport time > 15 minutes, consider contacting specialty transport. If antivenin is available, bring to ED with patient.
# ADULT NERVE GAS AUTO-INJECTOR GUIDELINES

**Purpose:**
To provide Illinois EMS agencies with guidelines on the appropriate use of Mark 1 kits (or equivalent). The Mark 1 kit contains antidotes to be used in instances of exposure to nerve agents (Sarin, Soman, Tabun, VX) or to muscarinic agents (lorsban, Cygon, Delnav malathion, Supracide parathion, Carbopenthion).

**Equipment:**
Each Mark 1 kit consists of two auto-injectors containing:
- atropine sulfate (atropine) 2 mg in 0.7 mL
- pralidoxime chloride (2 PAM) 600 mg in 2 mL
- other equivalent kit as available

**Key Provisions:**
Only those licensed EMS providers that are governed by the State of Illinois EMS Act (210 ICLS 50) are authorized by any EMS Medical Director to utilize the special equipment and medications needed in WMD incidents, including Mark 1 auto-injectors. When appropriate conditions warrant, contact Medical Control. Other organized response teams not governed by the EMS Act may use the Mark 1 auto-injectors on themselves or other team members when acting under the Illinois Emergency Management Agency Act (20 ILCS 3305).

**Guidelines:**
1. To utilize these kits, you must be an EMS agency or provider within an Illinois EMS System and participate within an EMS disaster preparedness plan.
2. The decision to utilize the Mark 1 antidote is authorized by this State protocol.
3. At a minimum, an EMS provider must be an Illinois EMT at any level, including First Responder with additional training in the use of the auto-injector.
4. **THE MARK 1 KIT IS NOT TO BE USED FOR PROPHYLAXIS.** The injectors are antidotes, not a preventative device. The Mark 1 kit may be self-administered if you become exposed and are symptomatic. Exit immediately to the Safe Zone for further medical attention.
5. Use of the Mark 1 kit is to be based on signs and symptoms of the patient. The suspicion or identified presence of a nerve agent is not sufficient reason to administer these medications.
6. Atropine may be administered IV or IM in situations where Mark 1 kits are not available.
7. If available, diazepam (Valium) or midazolam (Versed) may be cautiously given under Medical Control direction or by Standard Operating Procedures, if convulsions are not controlled.
8. When the nerve agents have been ingested, exposure may continue for some time due to slow absorption from the lower bowel. Fatal relapses have been reported after initial improvement. Continual medical monitoring and transport is mandatory.

If dermal exposure has occurred, decontamination is critical and should be done with standard decontamination procedures. Patient monitoring should be directed to the signs and symptoms, as with all nerve or muscarinic exposures. Continual medical monitoring and transport is mandatory.
### Mnemonic for Nerve Agent exposure:
- Salivation (excessive production of saliva)
- Lacrimation (excessive tearing)
- Urination (uncontrolled urine production)
- Defecation (uncontrolled bowel movement)
- Gastrointestinal distress (cramps)
- Emesis (excessive vomiting)
- Breathing difficulty
- Arrhythmias
- Miosis (pinpoint pupils)

### ADULT NERVE GAS AUTO-INJECTOR GUIDELINES

<table>
<thead>
<tr>
<th>EXPOSURE</th>
<th>CLINICAL</th>
<th>TREATMENT</th>
</tr>
</thead>
<tbody>
<tr>
<td>No signs or symptoms</td>
<td>None</td>
<td>Remove to Safe Zone, decontaminate, observe and transport</td>
</tr>
<tr>
<td>Mild Exposure</td>
<td>SOB, wheezing, runny nose</td>
<td>One Mark 1 kit or atropine 2 mg IV/IM and 2-PAM 600 mg IM (1 gram IV)</td>
</tr>
<tr>
<td>Moderate Exposure</td>
<td>Vomiting, diarrhea, pinpoint pupils, drooling</td>
<td>1-2 Mark 1 kit or atropine 2-4 mg IV/IM and 2-PAM 600-1200 mg IM (1 gram IV)</td>
</tr>
<tr>
<td>Severe Exposure</td>
<td>Unconsciousness, paralysis, cyanosis, seizures</td>
<td>Three Mark 1 kits or atropine 6 mg IV/IM and 2-PAM 1800 mg IM or 2-PAM 1 gram IV repeated twice at hourly intervals. Valium or Versed per Medical Control.</td>
</tr>
</tbody>
</table>

2-PAM solution needs to be prepared from the ampule containing 1 gram of desiccated 2-PAM: inject 3 mL of saline, 5% dextrose, or distilled or sterile water into ampule and shake well. The resulting solution is 3.3 mL of 300 mg/mL.
## RADIATION INJURIES

### BLS/ALS

1. **FOLLOW DIRECTIONS OF THE HAZMAT COMMAND ON SCENE.**

2. Patient management per appropriate SOP.

3. Contact Medical Control, as soon as practical, and indicate the following:
   - number of victims
   - medical status of victims
   - source of radiation
   - amount and kinds of radioactivity present

For assistance, 24-hour hotline number is available:
Illinois Emergency Management Agency: **1-800-782-7860**
### ADULT CHRONIC RENAL FAILURE - DIALYSIS PATIENT EMERGENCIES

#### BLS/ALS
- Do not take BP in same arm as shunt or fistula
- Control obvious hemorrhage from shunt or fistula (arterial bleeding)

#### ALS
- **IVs should not** be attempted on the extremity with the shunt or fistula
- When emergencies occur during dialysis, the staff may leave the access needles in place, clamping the tubing. If this is the only accessible site, request their assistance to connect your IV tubing.

#### ALS

**UNSTABLE:** altered mental status or signs of hypoperfusion

1. Adult Initial Medical Care SOP, p. 4-5
2. If lungs clear, administer *IV FLUID BOLUS of 200 mL*. May repeat if lungs clear.
3. If widened QRS complex, administer:
   - **SODIUM BICARBONATE 1 mEq/kg IV/IO**
4. If unresponsive to IV fluid bolus or pulmonary edema present, treat per CARDIOGENIC SHOCK SOP, p. 23

#### CARDIAC ARREST

1. Adult Initial Medical Care SOP, p. 4-5
2. Treat per appropriate cardiac arrest SOP
   - In addition to SOP medications, administer **SODIUM BICARBONATE 1 mEq/kg IV/IO**
## ADULT HEAT EMERGENCIES

### HEAT CRAMPS OR TETANY

**BLS/ALS**

1. Initial Trauma Care SOP, p. 56-58

2. Move patient to a cool environment. **DO NOT** massage cramped muscles.

3. If patient awake, alert, and has intact gag reflex, may give oral fluids.

### HEAT EXHAUSTION / HEAT STROKE

**BLS/ALS**

1. Remove as much clothing as possible to facilitate cooling.

2. Initiate rapid cooling:
   - Cold packs to lateral chest wall, groin, axilla, carotid arteries, temples, behind knees
   - Sponge or mist with cool water and fan, or cover body with wet sheet and fan body
   - Discontinue cooling if shivering occurs

3. Check blood glucose level if available. If < 60, treat per **ADULT DIABETIC / GLUCOSE EMERGENCES**, p. 30

**ALS**

4. **IV FLUID BOLUS** in 200 mL increments

5. If seizures occur, refer to **ADULT SEIZURES / STATUS EPILEPTICUS**, p. 32
## BLS/ALS

1. Initial Trauma Care SOP, p. 56-58

### FROSTBITE:

2. Rapidly rewarm frozen areas with tepid water. Hot packs wrapped in a towel may be used. **DO NOT RUB. DO NOT** thaw if there is a chance of refreezing.

3. HANDLE SKIN LIKE A BURN. Protect with light, dry sterile dressings. Do not let affected skin surfaces rub together.

4. If systolic BP > 100 mmHg, administer **FENTANYL 1 mcg/kg SLOW IV OR IM/IO/IN**, max first dose 100 mcg. Repeat dose 0.5 mcg/kg SLOW IV OR IM/IO/IN in 5 min, max repeat dose 50 mcg.
   - Patients > 65 years old and if systolic BP > 100 mmHg, administer **FENTANYL 0.5 mcg/kg SLOW IV OR IM/IO/IN**, max dose 50 mcg. Repeat dose 0.25 mcg/kg SLOW IV OR IM/IO/IN in 5 min, max repeat dose 25 mcg.

### MILD / MODERATE HYPOTHERMIA: conscious or altered sensorium, shivering

#### BLS/ALS

2. Check blood glucose level if available. If < 60, treat per **ADULT DIABETIC / GLUCOSE EMERGENCIES**, p. 30

3. Rewarm patient:
   - Place patient in a warm environment. Remove wet clothing.
   - Apply hot packs, wrapped in towels to axilla, groin, neck, thorax. Wrap patient in blankets.

### SEVERE HYPOTHERMIA: Poor muscle control or rigidity, simulating rigor mortis. There will be **no** shivering. Sensorium - confused, withdrawn, disoriented or comatose.

#### BLS/ALS

- **TRIPLE ZERO CANNOT BE CONFIRMED IN THE FIELD ON THESE PATIENTS**

2. Check pulse for 30-60 seconds. Anticipate bradycardia.

3. Begin **CPR** if pulseless.

4. **ALS**: If defibrillation indicated by rhythm, **DEFIBRILLATE** at 360 J (or initial biphasic shock at recommended energy) x 1 only and resume CPR.
   - Subsequent defibrillation attempts, and all medications, should be delayed until core temperature has been raised to ≥ 86° F by active rewarming

5. **ALS**: **INTUBATE** if indicated.

6. **ALS**: Establish vascular access IV/IO.

7. Transport patient in supine position, very gently to avoid precipitating VF.
ADULT BEHAVIORAL EMERGENCIES

BLS/ALS

1. Assess SCENE AND PERSONAL SAFETY. Call law enforcement personnel to scene, if needed. Above all, DO NOTHING TO JEOPARDIZE YOUR OWN SAFETY.

2. Adult Initial Medical Care SOP, p. 4-5, as situation warrants.
   - Determine and document if patient is a threat to self or others, or if patient is unable to care or provide for self. Do not leave patient alone.
   - Protect patients from harm to self or others.
   - ALS may be waived in favor of basic transport, if patient is uncooperative or dangerous.

3. Verbally attempt to calm and reorient the patient to reality as able. Do not participate in patient delusions or hallucinations.

4. If patient is combative, use restraints as necessary per System-specific policy.

5. Consider medical etiologies of behavior disorder and treat according to appropriate SOP:
   - Hypotension
   - Hypoxia
   - Substance abuse/Overdose
   - Neurologic disease (stroke, intracerebral bleed, head injury, etc.)
   - Metabolic imbalance (hypoglycemia, thyroid disease, etc.)
   - Seizure/Postictal

6. Consult Medical Control from the scene in ALL instances where refusal of transport is being considered.

ALS

7. For severe anxiety or agitation:
   - Administer VERSED (midazolam) 2 mg increments IV q 2 minutes up to 10 mg total as necessary.
   - May administer VERSED (midazolam) IM if unable to start IV
     ♦ < 70 kg = 5 mg IM
     ♦ ≥ 70 kg = 10 mg IM
General Guidelines

It is MANDATORY for Medical Control to notify the Trauma Surgeon immediately upon receiving the field report, if one of the following conditions exist:

- Sustained hypotension on two consecutive measurements five minutes apart
  - Adult systolic BP ≤ 90 mmHg or lack of a radial pulse
  - Pediatric systolic BP ≤ 80 mmHg
- Cavity penetration of torso or neck

The following patients or those who in the opinion of the American College of Surgeons Committee on Trauma are known to have an increased mortality/morbidity, if not treated at a Trauma Center. They should, therefore, be classified as trauma patients. These patients require transport to the nearest Trauma Center.

The decision to triage to the nearest trauma center or directly to a Level I trauma center remains with Medical Control, as does aeromedical evacuation.

Conditions that are marked with a star (★) and in bold letters in the following criteria should be considered for direct bypass to a Level I Trauma Center. If the transport time to a Level I is greater than 25 minutes, the patient should go to a Level II Trauma Center.

Any patient meeting the criteria for consideration of direct bypass to a Level I Trauma Center should be considered TIME-SENSITIVE. Contact Medical Control at the initial point of contact, as soon as a clinical impression has been formed from assessment findings.

Patients being bypassed to a Trauma Center need to have an adequate airway (i.e. respirations 12-35 per minute, intubated, cricothyroidotomy). If an airway cannot be established, the patient should be taken to the closest comprehensive Emergency Department.

EMS providers should notify Medical Control ASAP if the need for Level I bypass or specialty services exists. Once approved, the transporting unit should call the receiving hospital directly for notification.
REGION 8 TRAUMA CENTER SYSTEM
FIELD TRIAGE GUIDELINES

I. Physiologic Factors
   A. Adult Trauma Score of 9 or less
   B. Airway difficulties requiring intubation or other interventions at the scene.
   C. Trauma with altered respiratory rate (< 12 or > 35 per minute)
   D. Any multiple trauma patient with signs of hypoperfusion

II. Anatomic Factors
   A. Head, face, and eye
      ★ 1. HEAD INJURY WITH PERSISTENT UNCONSCIOUSNESS OR
         FOCAL SIGNS (i.e. SEIZURES, POSTURING, UNABLE TO
         RESPOND TO SIMPLE COMMANDS)
      ★ 2. PENETRATING INJURY TO THE NECK
         3. Head injury with loss of consciousness or Glasgow Coma Scale score
            of ≤ 10
         4. Traumatic and chemical eye injuries
         5. Maxillofacial trauma
   B. Chest
      ★ 1. GUNSHOT WOUND OR OTHER PENETRATING INJURY TO THE
         CHEST
         2. Blunt chest trauma (significant pain and/or obvious external signs).
         3. Flail chest and unstable chest wall
   C. Abdomen
      ★ 1. GUNSHOT WOUND TO THE ABDOMEN
      ★ 2. OTHER PENETRATING INJURY TO THE ABDOMEN, GROIN OR
         BUTTOCKS
         3. Blunt abdominal trauma (significant pain and/or obvious external signs)
   D. Spinal Cord
      ★ 1. SPINAL CORD INJURY WITH PARALYSIS, PARESTHESIA OF
         EXTREMITIES AND/OR SENSORY LOSS
         2. Any suspected spinal cord injury in the absence of neurological deficit
   E. Extremities
      ★ 1. EXTREMITY TRAUMA: MANGLED, CRUSHED, OR DEGLOVED
         WITH NEUROVASCULAR COMPROMISE
      ★ 2. TRAUMATIC AMPUTATION PROXIMAL TO THE WRIST OR ANKLE
         3. Limb paralysis and/or sensory deficit proximal to the wrist
         4. Multiple orthopedic injuries (> 1 long bone fracture)

III. Deceleration Injury
   A. High energy dissipation / rapid deceleration with blunt chest or abdominal
      injury
   B. Falls ≥ 20 feet with the adult patient
   C. Falls ≥ 3 times the height of a pediatric patient
# REGION 8 TRAUMA CENTER SYSTEM
## FIELD TRIAGE GUIDELINES

### IV. Motor Vehicle Crashes
- Extrication time ≥ 20 minutes
- Vehicle passenger space invaded by ≥ 12 inches
- Ejection
- Fatality at the scene within the same motor vehicle
- Rollover ≥ 180° spin
- Child ≤ 15 years struck by car
- Child ≤ 8 years old involved in any MVC without age-appropriate restraint (under age 4 or < 40 pounds requires a car seat)
- Motorcycle crash > 20 MPH with separation of rider from bike

### V. Major Burns
- 10% total body surface area of 2nd and 3rd degree burns
- Any burn patient with obvious head, neck, or airway involvement

### VI. Pediatric Trauma with one or more of the following:
- **HEAD TRAUMA WITH PERSISTENT ALTERED LEVEL OF CONSCIOUSNESS**
- **OBVIOUS CHEST OR ABDOMINAL TRAUMA, EITHER PENETRATING OR BLUNT**
- Pediatric Trauma Score of ≤ 8
- Child ≤ 15 years old, struck by motor vehicle
- Child involved in an MVC not appropriately restrained
  - Rear-facing seat from birth to 2 years old or up to 20 lbs
  - Forward-facing toddler seat from 2 - 4 years or up to 65 lbs
  - Booster seat from 4 - 8 years or up to 4’ 9” tall
  - Safety belts from 8 - 15 years or at least 4’ 9” tall

### VII. Pregnant Trauma Patients
- The pregnant patient ≥ 20 weeks gestation
- Pregnant patient who meets any other trauma criteria

### VIII. Blunt and Penetrating Traumatic Arrests are at the discretion of Medical Control
- Blunt traumatic arrest patients: may consider withholding resuscitative efforts. Refer to WITHHOLDING OR WITHDRAWING RESUSCITATIVE EFFORTS SOP, P. 12
A multiple patient incident exists when:
- responding EMS providers can mitigate life-threats using standard operating procedures, and
- the responding EMS agency is able to acquire adequate numbers of responders and ambulances to provide normal levels of care and transportation, and
- hospitals that can be reached within the normally accepted transport time can provide adequate patient stabilization until definitive care can be provided. This may require receiving hospitals to activate their internal disaster plans, even though it is not necessary to implement the mass casualty response in the field.

Practical application:
- No triage tags necessary (but may be used)
- Ambulance transport as usual
- Medical Control radio contact by each transporting ambulance as usual
- Patient Care Reports to be completed as usual

1. First EMS Unit on scene:
- One responder begins scene size-up and calls for additional resources
- Other responder(s) begin(s) primary triage using the START or JumpSTART triage process
- Initial contact with Medical Control at the closest hospital and report the nature of the incident and potential number of victims per System-specific policy.

2. Scene command decision:
- Begin transport of 2 of the most critical (red) patients to each of the nearest hospitals (adhering to trauma triage criteria for Level I and II transports) to help clear the scene.
- Transporting EMS providers shall contact the receiving hospital for on-line Medical Control.

3. Remaining patient disposition:
- **Joint decision with Medical Control:** When the number of ill or injured persons exceeds the transport of 2 (of the most critical) patients to each of the nearest hospitals, contact the closest Resource or Associate Hospital to coordinate remaining patient distribution. Inform them about the nature of the incident, the number of patients and their acuity levels.
  - The hospital will assess receiving hospital status and relay receiving availability to scene.
  - Make all attempts to evenly distribute remaining patients to local hospitals; do not overburden one facility.
  - While it is preferable to keep families together, it is not always in the best interest of patient care to do so.
  - The hospitals will consider time of day, hospital resources available, patient acuity and trauma triage criteria in determining patient destinations.
  - Follow System-specific policy regarding contact of EMS Medical Director and/or EMS System Coordinator.

# MASS CASUALTY INCIDENTS / DISASTERS (MCI)

Mass Casualty Incidents in Region VIII are governed by MABAS Divisions and County or System Mass Casualty Plans. Roles will vary. It is recommended that at least the following are designated for EMS purposes: Triage, Treatment and Transportation Groups.

## A mass casualty incident exists when the:

- number of patients and the nature of their injuries make the normal prehospital level of stabilization and care unachievable; **and/or**
- resources that can be brought to the field within primary and secondary response times are insufficient to manage the scene under normal operating procedures; **and/or**
- stabilization capabilities of area hospitals are insufficient to handle all the patients.

### Practical application:

- Triage tags are to be used on all patients
- May transport more than one patient in each ambulance
- No radio reports to hospitals; treat per SOPs
- No individual run reports necessary

## 1. First EMS unit on scene establishes temporary scene command:

- One responder begins scene size up and calls for additional resources
- Other responder(s) begin(s) primary triage using START or JumpSTART and SMART Tag™ systems

## 2. Scene command / Joint decisions with Medical Control:

- Call Resource Hospital from scene.
  - Relay nature of incident; number of victims; general acuity; age groups, special needs and estimated time of arrival.
  - Maintain communications with hospital once established.
  - Keep line open for updates.
- Resource Hospital shall assess receiving hospital status and relay receiving availability to scene.
- Transportation officer should determine hospital destinations based on time of day, hospital resources available, and patient acuity.
  - Make all attempts to evenly distribute remaining patients to area hospitals; do not overburden one facility.
  - This may mean transports of longer than 25 minutes depending on patient volume.
  - Preferable, but not necessary, to keep families together.
  - Trauma triage criteria to Level I and Level II trauma centers no longer apply.

## 3. Depending on the nature and magnitude of an incident, the EMS Medical Director or State Medical Director may suspend all EMS operations as usual and direct that all care be conducted by SOP and/or using personnel and resources as available.
JumpSTART Triage Algorithm

Able to walk? Yes → MINOR → Secondary Triage

Spontaneous Breathing? No → Position Upper Airway

Breathing No → DECEASED

Apnea No → DECEASED

Palpable Pulse? No → IMEDIATE

Give 5 rescue breaths

Remains Apneic

Breathing

Respiratory Rate

<15 or >45

15 - 45

Palpable Pulse? No → IMEDIATE

Yes → AVPU

"P" (inappropriate), Posturing or "U"

DELAYED
SPECIALTY TRANSPORT

BLS/ALS

GENERAL CONSIDERATION

1. In appropriate situations, EMS providers may request from Medical Control the dispatch of specialty transportation services (helicopter or hospital-based ground units) to the scene of a prehospital emergency in accordance with the following criteria:

   - The patient meets trauma center criteria and transport time by the specialized unit to the desired center is less than a EMS providers transport time

   OR

   - Benefits to the patient due to the increased level of expertise of the specialized unit staff outweigh increased transport times

2. If EMS providers conclude that specialty transport services are necessary, the provider agency may contact the specialty service and place the unit on standby prior to contacting Medical Control.

   - A prolonged extrication alone is not sufficient reason to call a specialty transport service. Serious injuries must accompany prolonged extrication.
   - At no time shall a patient be transported from the scene via specialty service without authorization from Medical Control.

3. Assess the need for specialty transport services based upon:

   - Patient history
   - The course of events (mechanism of injury, extrication times, etc.)
   - The patient's condition as assessed at the scene
   - Current local traffic patterns
   - Weather conditions

4. Follow SOPs in providing care until the arrival of the specialty transport unit

5. Medical Control will establish a prioritized listing of specialty transport services available in their geographic area
SPECIALTY TRANSPORT

BLS/ALS

REQUESTING SPECIALTY TRANSPORT

SPECIALTY TRANSPORT CONSIDERATIONS:

If the EMS provider feels the patient would benefit from specialty transport services, the EMS provider should:

1. Request for specialty transport to be placed on standby.

2. Contact Medical Control. Relay the following information:
   - History of event
   - Patient's vital signs and present condition
   - Reason for requesting specialty transport
   - Name and whether or not the specialty service has been placed on standby

3. Medical Control shall make the decision authorizing specialty transport and the receiving facility.

4. If the specialty unit is approved, the most common mechanism is for the EMS provider to communicate directly with the specialty provider. If Medical Control is handling the relay of information, be prepared to relay the following information:
   - number of patients
   - type and extent of injuries
   - vital signs and pertinent history
   - proposed landing site/scene location
   - unusual circumstances, e.g. hazardous materials

ADULT INITIAL TRAUMA CARE

BLS/ALS

SCENE SIZE UP
- Assess and secure scene safety.
- Use standard precautions on all patients.
- If indicated, follow department HazMat protocols.
- If a potential crime scene, make efforts to preserve integrity of possible evidence.
- Anticipate potential injuries based on the mechanism of energy transfer.

INITIAL ASSESSMENT:

1. AIRWAY/C-SPINE: Consider Spinal Motion Restriction. Position airway and suction as needed. Advanced airway procedures as indicated. If unable to secure by other means, consider CRICOTHYROIDOTOMY.

2. BREATHING/VENTILATION: Assess ventilation and oxygenation; expose chest as needed.
   - Auscultate breath sounds.
   - Consider need for supplemental oxygen, especially for patients with dyspnea, suspected hypoxemia or altered mental status.
     ♦ Evaluate oxygen saturation if pulse oximetry available.
     ♦ Target SpO2 94-98% (92% if hx of COPD).

<table>
<thead>
<tr>
<th>Respiratory Assessment / Findings</th>
<th>Oxygen Administration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adequate rate/depth, minimal distress, mild hypoxia, baseline SpO2 92-94% (88-91% COPD)</td>
<td>Low FiO2</td>
</tr>
<tr>
<td>Adequate rate/depth, moderate/severe distress, SpO2 &lt; 92% (&lt; 88% COPD)</td>
<td>High FiO2</td>
</tr>
<tr>
<td>Inadequate rate/depth with moderate/severe distress, unstable</td>
<td>High FiO2 by BVM ventilation</td>
</tr>
</tbody>
</table>

- Hyperoxia contraindicated in uncomplicated myocardial infarction / STEMI, post-cardiac arrest, acute exacerbations of COPD, stroke, newly born / neonatal resuscitation. If supplemental oxygen is used in these patients, the goal is to relieve hypoxemia without causing hyperoxia (target SpO2 94%, not 100%).

3. CIRCULATION: assess cardiovascular status.
   - If no carotid pulse, follow ADULT TRAUMATIC ARREST SOP, p. 62.
   - Control all external hemorrhage.
     ♦ If available, for severe hemorrhage, apply Tourniquet for extremity injury or HEMOSTATIC GAUZE with direct pressure; do not release tourniquet or remove dressings once applied, note time applied.

   - ALS: Obtain VASCULAR ACCESS. Infusion rate as follows:
     ♦ Inadequate perfusion (altered mental status or signs of hypoperfusion): Attempt vascular access (large bore IV or IO if the patient meets all other criteria) enroute. Minimum fluid volume of 2 L unless contraindicated. Infusion rate based on clinical presentation.
**ADULT INITIAL TRAUMA CARE**

- **Adequate perfusion:** Attempt IV enroute. Titrate fluid volume to patient condition.
  - Monitor ECG as appropriate
  - Consider 12-Lead in chest injuries and electrical injuries / burns
  - Place a pelvic stabilizing device for suspected pelvic instability.

4. **DISABILITY/MINI-NEUROLOGICAL EXAM:** Assess AVPU along with Glasgow Coma Scale and evaluate neurological function

**ALS**
- If GCS score ≤ 8, see ADULT HEAD INJURIES SOP, p. 60
- No neurological impairment: Reassess periodically and document changes
- Altered Mental Status: Seizure and vomiting precautions. Check glucose level. If glucose < 60, treat per ADULT DIABETIC EMERGENCIES SOP, p. 30

**BLS/ALS**
5. Expose and examine as indicated. Consider potential injuries based on mechanism of injury.
6. Identify priority transport.
7. Spine Motion Restriction as indicated.
8. Assess pain score on a scale from 0-10. Treat pain per appropriate SOP.

**TRANSPORT DECISION:** Once the initial assessment and resuscitative interventions are initiated, a decision must be made whether to continue with the rapid trauma survey and the need for additional interventions on scene, or to transport rapidly with interventions enroute. Document the patient condition(s) or behavior(s) that necessitated this decision.

Transport to closest appropriate facility per TRAUMA REGION FIELD TRIAGE GUIDELINES, p. 47-49

**RAPID TRAUMA SURVEY** (as allowed by time and patient condition)

1. Systematic head-to-toe assessment
2. SAMPLE history
3. Recheck and record vital signs and patient condition at least q 15 minutes as able, and after each ALS intervention. For unstable patients, more frequent reassessment may be needed. Note the time obtained.
4. Adult Revised Trauma Score

**TOTAL REVISED TRAUMA SCORE:** (0-12)
# ADULT HEAD INJURIES

## BLS/ALS

1. Adult Initial Trauma Care SOP, p. 56-58
   - Assure adequacy of ventilation
   - Consider **Spinal Motion Restriction** as indicated.
   - Keep patient flat
   - Take vomiting and seizure precautions
   - Glasgow Coma Scale (GCS) score
   - Identify deficits

2. Begin expeditious transport and contact Medical Control enroute

## Altered Mental Status

### ALS

3. If GCS score ≤ 8, **INTUBATE** using in-line procedure. If unable to INTUBATE, consider use of **ALTERNATE AIRWAY DEVICE**. Refer to **ADULT DRUG ASSISTED INTUBATION – ETOMIDATE** SOP, p. 25, if indicated.

4. Obtain and record blood glucose level, if available. If glucose < 60, treat per **ADULT DIABETIC / GLUCOSE EMERGENCIES**, p. 30

5. If seizure activity, treat per **ADULT SEIZURES / STATUS EPILEPTICUS**, p. 32

6. For the combative patient, consider **VERSED** (midazolam) **2 mg increments** IV q 2 minutes up to 10 mg total as necessary.
   - May administer **VERSED** (midazolam) **IM** if unable to start IV
     - < 70 kg = 5 mg IM
     - ≥ 70 kg = 10 mg IM
### ADULT SPINE INJURIES

#### BLS/ALS

1. Adult Initial Trauma Care SOP, p. 56-58
   - Spinal Motion Restriction
   - Keep patient flat
   - Take vomiting and seizure precautions
   - Glasgow Coma Scale (GCS) score

#### ALS

If signs of hypoperfusion (consider neurogenic shock):

2. Systolic BP < 90 mmHg
   - IV FLUID BOLUS in 200 mL increments as needed up to 2 L

If hypoperfusion continues with bradycardia:

3. Continue IV fluids and administer ATROPINE 0.5 mg IV/IO q 3 minutes up to a total dose of 3 mg

#### Altered Mental Status

4. If GCS score ≤ 8, INTUBATE using in-line procedure. If unable to INTUBATE, consider use of Alternate Airway. Refer to ADULT DRUG ASSISTED INTUBATION - ETOMIDATE SOP, p. 25, if indicated.

5. Obtain and record blood glucose level, if available. If glucose < 60, treat per ADULT DIABETIC / GLUCOSE EMERGENCIES, p. 30

6. If seizure activity, treat per ADULT SEIZURES / STATUS EPILEPTICUS, p. 32
## ADULT CHEST INJURIES

### BLS/ALS

3. Adult Initial Trauma Care SOP, p. 56-58
   - HIGH FiO₂ or VENTILATION
4. Begin expeditious transport to appropriate facility and contact Medical Control enroute

### SUCKING CHEST WOUND/OPEN PNEUMOTHORAX

3. Apply occlusive dressing / chest seal per System-specific procedure
4. If patient deteriorates, remove dressing temporarily to allow air to escape
5. **ALS**: Consider intubation

### FLAIL CHEST

3. If respiratory distress, appropriately **VENTILATE WITH HIGH FiO₂ VIA BVM** to provide internal splinting.
4. **ALS**: Consider intubation

### TENSION PNEUMOTHORAX

3. Suspect when patient presents with severe respiratory distress or difficulty ventilating, hypotension, distended neck veins, absent breath sounds on the involved side, and/or tracheal deviation.
4. **ALS**: **PLEURAL DECOMPRESSION** of affected side, per System-specific procedure
5. Assess for PEA. If present, refer to **ADULT ASYSTOLE / PEA SOP**, p. 21
### ADULT TRAUMATIC ARREST

**BLS/ALS**
1. If obviously dead, refer to Withholding or Withdrawal of Resuscitative Efforts SOP, p. 8
2. If injury is incompatible with life (e.g. massive brain matter visible), contact Medical Control for possible scene pronouncement.

**ALS**
3. If patient experiences loss of pulses under direct paramedic observation during transport:
   - Adult Initial Trauma Care SOP, p. 56-58
   - Consider BILATERAL PLEURAL DECOMPRESSION
   - Consider appropriate cardiac arrest SOP
   - Verify tube placement if intubated

**Note:** After Spine Motion Restriction and airway control is established, procedures are to be performed enroute.
# ADULT OPHTHALMIC EMERGENCIES

## GENERAL APPROACH

### BLS/ALS
1. **Adult Initial Trauma Care SOP, p. 56-58**
   - Assess pain on a 0-10 scale
   - Quickly obtain gross visual acuity in each eye: light perception, motion, acuity
   - Discourage patient from sneezing, coughing, straining or bending at the waist
   - Elevate head of cot or backboard Semi-Fowler’s position unless contraindicated
   - Vomiting precautions

### ALS
2. If systolic BP > 100 mmHg, administer **FENTANYL 1 mcg/kg SLOW IV OR IM/IO/IN, max first dose 100 mcg. Repeat dose 0.5 mcg/kg SLOW IV OR IM/IO/IN in 5 min, max repeat dose 50 mcg.**
   - Patients > 65 years old and if systolic BP > 100 mmHg, administer **FENTANYL 0.5 mcg/kg SLOW IV OR IM/IO/IN, max dose 50 mcg. Repeat dose 0.25 mcg/kg SLOW IV OR IM/IO/IN in 5 min, max repeat dose 25 mcg.**

## CHEMICAL SPLASH/BURN

2. **BLS/ALS:** Immediately irrigate affected eye(s) using copious amounts of normal saline. Continue irrigation while enroute to hospital.
3. **ALS:** Instill **0.5% TETRACAINE 1 drop** in each affected eye. May repeat until pain relief achieved.
4. **ALS:** Irrigate per appropriate System-specific procedure.

## SUSPECTED CORNEAL ABRASIONS

2. **ALS:** Instill **0.5% TETRACAINE 1 drop** in each affected eye. May repeat until pain relief achieved.
3. Patch affected eye(s).

## PENETRATING INJURY/RUPTURED GLOBE

2. **Do not** remove impaled objects; **do not** irrigate or instill tetracaine.
3. Avoid any pressure on the injured eye(s). Cover with cup, or metal or plastic protective shield.
4. Patch unaffected eye.
# ADULT BURN INJURIES

## BLS/ALS

1. Adult Initial Trauma Care SOP, p. 56-58
2. Unresponsive patients found at the scene of a fire, consider cyanide poisoning. Refer to ADULT TOXICOLOGIC EMERGENCIES SOP, p. 35-37
3. Evaluate depth of burn and estimate extent using rule of nines or palm method (patient's palm equals 1% BSA). Assess need for transport to Burn Center.

## ALS

4. If systolic BP > 100 mmHg, administer FENTANYL 1 mcg/kg SLOW IV OR IM/IO/IN, max first dose 100 mcg. Repeat dose 0.5 mcg/kg SLOW IV OR IM/IO/IN in 5 min, max repeat dose 50 mcg.
   - Patients > 65 years old and if systolic BP > 100 mmHg, administer FENTANYL 0.5 mcg/kg SLOW IV OR IM/IO/IN, max first dose 50 mcg. Repeat dose 0.25 mcg/kg SLOW IV OR IM/IO/IN in 5 min, max repeat dose 25 mcg
5. Consider aggressive fluid resuscitation per Parkland Formula (4 ml x kg x % BSA burned = amount IV fluid delivered in first 24 hour period. Half of the amount to be infused over first 8 hours, other half to be infused over last 16 hours).

## THERMAL BURNS

4. If burned area ≤ 10% TBSA:
   - Cool burned area for no longer than five minutes with water or saline, if burn occurred within 15 minutes. Wet dressing may be applied for local pain relief.
5. Wear gloves and mask until burn wounds are covered.
6. DO NOT break blisters. If > 10% TBSA affected, cover burn with DRY, sterile dressings.
7. Open dry sheet on stretcher before placing patient for transport. Cover patient with dry sheets and blanket to maintain body temperature.

## INHALATION BURNS

4. Note presence of wheezing, hoarseness, stridor, carbonaceous (black) sputum / cough, singed nasal hair / eyebrows / eyelashes.
5. HIGH FiO₂ or VENTILATION

## ALS

- Consider INTUBATION if severe respiratory distress. If intubation unsuccessful, consider CRICOTHYROIDOTOMY.
- If wheezing, consider ALBUTEROL 2.5 mg (3 mL) via nebulizer. May repeat x 1.
**ADULT BURN INJURIES**

**ELECTRICAL BURNS**
4. **Spine Motion Restriction** as indicated

**ALS**
5. Assess ECG for dysrhythmias and treat according to appropriate SOP
6. Assess for wounds, including neurovascular status
7. Cover wounds with dry sterile dressing (cooling not necessary)

**CHEMICAL BURNS**
4. HazMat precautions
5. If powdered chemical, brush away access. Remove clothing, if possible.
6. Irrigate with copious amounts of sterile water or NS ASAP and while enroute.
EMD (TASER) WEAPONS INJURIES

**BLS/ALS**
This SOP is to be used for patients who have been subdued by the use of any electromuscular disruption (EMD) weapon (i.e. TASER®)

1. **Assess scene and personal safety**

2. **Adult Initial Trauma Care SOP, p. 56-58**
   - Assess for injury and/or altered mental status and treat per appropriate SOP.
   - Obtain baseline vital signs.
     - If ALS, include ECG monitoring for cardiac abnormalities
     - If ALS and patient > 35 years of age, consider 12-lead ECG.
   - Identify location of probes on the patient's body. Evaluate depth of skin penetration.

3. **If darts are embedded in any of the following areas, stabilize in place and transport patient:**
   - lid/globe of the eye
   - face or neck
   - genitalia
   - bony prominence
   - spinal column

4. If darts are found to be superficially embedded in other locations, they may be removed as follows:
   - Place one hand on the patient where the dart is embedded to stabilize the skin surrounding the puncture site.
   - Firmly grasp the probe with your other hand.
   - Remove by gently pulling the dart straight out along the same plane it entered the body.
   - Assure that the dart is intact
   - Repeat procedure with second dart, if embedded.
   - Return the darts to law enforcement officials, utilizing standard precautions.

5. **Control minor hemorrhage and cleanse the wound area with normal saline.**

6. **If indicated, cover wound area with a dry dressing.**

7. **Transport decision:**
   - Transport decisions regarding patients subdued by EMD weapons should be based on patient condition.
   - If the patient has not had a tetanus immunization in the last five years, they should be advised to get one.
ADULT MUSCULOSKELETAL INJURIES

BLS/ALS

1. Adult Initial Trauma Care SOP, p. 56-58

2. **ALS**: Consider analgesia, if patient is hemodynamically stable
   - **NITROUS OXIDE** per System-specific policy for MILD pain
   - For SEVERE pain:
     - If systolic BP > 100 mmHg, administer **FENTANYL 1 mcg/kg SLOW IV OR IM/IO/IN**, max first dose 100 mcg. Repeat dose 0.5 mcg/kg SLOW IV OR IM/IO/IN in 5 min, max repeat dose 50 mcg.
     - Patients > 65 years old and if systolic BP > 100 mmHg, administer **FENTANYL 0.5 mcg/kg SLOW IV OR IM/IO/IN**, max first does 50 mcg. Repeat dose 0.25 mcg/kg SLOW IV OR IM/IO/IN in 5 min, max repeat dose 25 mcg.

3. Splint or immobilize injuries as indicated. If pulses are lost after applying a traction splint, leave splint in place. Do not release traction. Notify Medical Control of change in status.

4. Elevate extremity and or apply cold pack after splinting when appropriate.

5. **ALS**: If long bone fracture with displacement/muscle spasm, and hemodynamically stable, consider **VERSED** (midazolam) 2 mg increments IV/IM/IN q 2 minutes up to 10 mg total as necessary.

AMPUTATION / DEGLOVING INJURIES

6. If amputation is incomplete, stabilize with bulky dressing.

7. If uncontrolled bleeding continues, apply tourniquet above amputation as close as possible to the injury. Note time tourniquet applied. DO NOT release tourniquet once it has been applied.

8. Care of amputated parts:
   - Wrap in normal saline moistened gauze or towel. Place in plastic bag and seal. DO NOT immerse tissue directly in water or normal saline.
   - Place plastic bag in second container filled with ice or cold water or place on cold packs and bring with patient to the hospital.
ADULT MUSCULOSKELETAL INJURIES

INCAPACITATING BACK PAIN (traumatic and non-traumatic origin)

BLS/ALS
1. Adult Initial Trauma Care SOP, p. 56-58
   • Severe pain = the patient is unable to move or be moved due to pain

2. Assess patient to differentiate musculoskeletal back pain from aortic aneurysm pain.
   • history of onset and character of pain
   • hypotension or syncope
   • pain described as “tearing” or “ripping”
   • presence or absence of femoral pulses and mottling of lower extremities
   • any negative neurological finding

3. Assess for injury and consider **Spine Motion Restriction** as indicated. Check for distal vascular, motor, and sensory function.

ALS
4. If hemodynamically stable, consider analgesia:
   • **NITROUS OXIDE** per System-specific policy
   • If systolic BP > 100 mmHg, administer FENTANYL 1 mcg/kg SLOW IV OR IM/IO/IN, max first dose 100 mcg. Repeat dose 0.5 mcg/kg SLOW IV OR IM/IO/IN in 5 min, max repeat dose 50 mcg, until patient is able to be moved to stretcher.
   • Patients > 65 years old and if systolic BP > 100 mmHg, administer FENTANYL 0.5 mcg/kg SLOW IV OR IM/IO/IN, max first does 50 mcg. Repeat dose 0.25 mcg/kg SLOW IV OR IM/IO/IN in 5 min, max repeat dose 25 mcg, until patient is able to be moved to stretcher.

5. If patient is experiencing nausea or vomiting, consider administering ZOFRAN (ondansetron) **ODT 4 mg tab or 4 mg slow IV** x 1 dose only.
## ADULT NEAR DROWNING

### BLS/ALS

1. Adult Initial Trauma Care SOP, p. 56-58

2. Remove wet clothing

3. Assess patient's temperature
   - If NORMOTHERMIC, treat dysrhythmias per appropriate SOP, p. 13-21
   - If HYPOTHERMIC, treat per ADULT COLD EMERGENCIES SOP, p. 45

4. Treat other symptoms per appropriate SOP
### IL DEPARTMENT OF HEALTH

<tr>
<td><strong>3.</strong> Raise right side of backboard 20-30° to place patient on left side.</td>
</tr>
<tr>
<td><strong>4.</strong> If CPR indicated, manually displace uterus to left side. Follow appropriate Cardiac Arrest SOP, p. 19-21.</td>
</tr>
<tr>
<td><strong>5.</strong> Notify Medical Control ASAP in order to mobilize appropriate hospital personnel.</td>
</tr>
</tbody>
</table>
## Obstetrical Complications

### BLS/ALS

1. **Adult Initial Medical Care SOP, p. 4-5**
2. **HIGH FiO₂ or Ventilation**
   - **ALS:** If altered mental status or signs of hypoperfusion, **IV fluid bolus in 200 mL increments** titrated to patient response.
   - Palpate abdomen to determine uterine tone and presence of contractions.
   - Place mother on left side or raise right side of backboard 20-30°. Insert second IV line if no response to initial fluids.

### Bleeding in Pregnancy

3. Note type, color and amount of bleeding and/or vaginal discharge. If tissue passes, collect and bring to the hospital with the patient.

### Toxemia in Pregnancy or Pregnancy Induced Hypertension

4. **ALS:** If seizure occurs:
   - Administer **VERSED** (midazolam) 2 mg increments IV/IN q 2 minutes up to 10 mg total as necessary, titrated to control seizures.
EMERGENCY CHILDBIRTH - PHASE I: UNCOMPLICATED LABOR

PHASE I: UNCOMPLICATED LABOR

BLS/ALS

1. Obtain history and determine if there is adequate time to transport
   - Gravida (number of pregnancies) and Para (number of live births).
   - Number of miscarriages, stillbirths, and multiple births.
   - Due date (expected date of confinement, “EDC”) or date of LMP (last menstrual period).
   - Onset, duration, and frequency of contractions (time from beginning of one contraction to beginning of the next).
   - Length of previous labors in hours.
   - Status of membranes, intact or ruptured. If ruptured, inspect for prolapsed cord or evidence of meconium.

   HIGH RISK CONCERNS:
   - maternal drug abuse
   - teenage pregnancy
   - history of diabetes/hypertension/cardiovascular disease/other pre-existing diseases that may compromise mother and/or fetus
   - preterm labor (< 37 weeks)
   - previous breech or C-section.

2. Inspect for bulging perineum, crowning, or whether patient is involuntarily pushing with contractions. If contractions are two minutes apart with crowning or any of the above are present, prepare for delivery. If delivery is not imminent, transport on left side. **DO NOT ATTEMPT TO RESTRAIN OR DELAY DELIVERY UNLESS PROLAPSED CORD IS NOTED.**

IF DELIVERY IS IMMINENT:

3. Adult Initial Medical Care SOP, p. 4-5
   - If patient is hyperventilating, coach her to take slow deep breaths
   - **ALS:** If patient becomes hypotensive or lightheaded at any time, **IV FLUID BOLUS** in 200 mL increments

4. Position patient supine on a flat surface, if possible. Use standard precautions.

<table>
<thead>
<tr>
<th>PHASE II: DELIVERY</th>
</tr>
</thead>
<tbody>
<tr>
<td>6. Control rate of delivery by placing palm of one hand over occiput. Protect perineum with pressure from other hand.</td>
</tr>
<tr>
<td>7. If amniotic sac is still intact, gently twist or tear the membrane. Note presence or absence of meconium.</td>
</tr>
<tr>
<td>8. Once the head is delivered, allow it to passively turn to one side.</td>
</tr>
<tr>
<td>9. Feel around the neck for the umbilical cord (nuchal cord). If present, attempt to gently lift it over the head. If unsuccessful, double clamp and cut the cord between the clamps.</td>
</tr>
<tr>
<td>10. To facilitate delivery of the upper shoulder, gently guide to head downward. Once the upper shoulder is delivered, support and lift the head and neck slightly to deliver the lower shoulder. Allow head to deliver passively.</td>
</tr>
<tr>
<td>11. The rest of the newly born should deliver quickly with one contraction. Firmly grasp the newly born as it emerges. Newly born will be wet and slippery.</td>
</tr>
<tr>
<td>12. Keep newly born level with vagina until cord stops pulsating and is double clamped.</td>
</tr>
</tbody>
</table>
EMERGENCY CHILDBIRTH - PHASE III: CARE OF THE NEWLY BORN

PHASE III: CARE OF THE NEWLY BORN
NOTE: The majority of newborns require no resuscitation beyond maintenance of temperature, mild stimulation, and suctioning of the airway. Transport is indicated as soon as the airway is secured and resuscitative interventions, if needed, are initiated. If the APGAR score is < 6 at 1 minute or meconium is present, begin resuscitation.

BLS / ALS
1. Pediatric Initial Medical Care SOP, p. 79
2. Deliver head and body
3. Clamp and cut cord
4. Assess newly born risk factors:
   - Term gestation?
   - Clear amniotic fluid?
   - Breathing or crying?
   - Good muscle tone?
5. Provide basic care:
   - Provide warmth
   - Position; clear airway as needed with bulb syringe or suction, nose before mouth
   - Dry the newly born, stimulate and reposition as needed
6. Assess condition and respirations:
   - If non-vigorous, apneic or gasping/labored breathing, **suction airway** as needed and begin **positive pressure ventilation** on room air for 30 seconds
   - Begin cardiac monitoring
   - Consider SpO2 monitoring, if available
   - The goal is a positive trend with a target SpO2 of 85% - 95% at 10 minutes
7. Check heart rate

<table>
<thead>
<tr>
<th>HR &lt; 60</th>
<th>HR 60 – 100</th>
<th>HR &gt; 100</th>
</tr>
</thead>
<tbody>
<tr>
<td>• CPR for 30 seconds at a ratio of 3:1 with ventilations (FiO2 of 21–30%)</td>
<td>• continue ventilations for 1-2 minutes, reassess</td>

| • attempt **ENDOTRACHEAL INTUBATION** and **VASCULAR ACCESS** | • Provide basic care | |
| • **EPINEPHRINE** 1:10,000 0.1 mL/kg IV/IO or 0.3 mL/kg ET | | |
| ✶ HR remains 60 – 100 | | |
| • **EPINEPHRINE** q 3 min with continuous CPR as long as HR remains < 60 | | |
| | | |
| | | |
EMERGENCY CHILDBIRTH - PHASE IV: POSTPARTUM CARE

PHASE IV: POSTPARTUM CARE

1. Placenta should deliver in 20-30 minutes. If delivered, collect in plastic bag from OB kit and transport to hospital for inspection. Do **NOT** pull on cord to facilitate delivery of the placenta. **DO NOT DELAY TRANSPORT AWAITING DELIVERY OF PLACENTA.**

2. If perineum is torn and/or bleeding, apply direct pressure with sanitary pads, and have patient bring her legs together. Apply cold pack or ice bag to perineum (over pad) for comfort and to reduce swelling.

3. If estimated blood loss > 500 mL:
   - **ALS:** IV FLUID BOLUS in 200 mL increments titrated to patient response.
   - Massage top of uterus (fundus) until firm.
   - Breast-feeding may increase uterine tone. Allow newly born to nurse.

4. If signs of hypoperfusion despite above treatment, start second IV enroute and fluid boluses.

SPECIAL CONSIDERATIONS:

- Focus should be on newborns appearance, not the presence of meconium
- Consider APGAR at 1 and 5 minutes, but do not interrupt resuscitation to obtain
- Per Medical Control, consider:
  - DEXTROSE 12.5% 2 mL/kg IV/IO
  - IV FLUID BOLUS of 10 mL/kg
  - NARCAN (naloxone) 0.1 mg/kg IV/IN/IO
<table>

## DELIVERY COMPLICATIONS

### BLS/ALS

1. **Adult Initial Medical Care SOP, p. 4-5**
   - HIGH FiO\textsubscript{2} or VENTILATION
   - LOAD AND GO SITUATION with treatment enroute
   - Contact Medical Control enroute as soon as possible

### SHOULDER DYSTOCIA

2. Place mother supine with knees to shoulders and reattempt delivery
3. If unsuccessful, return to supine position. Provide supplemental oxygen to newly born and protect head

### BREECH BIRTH

2. **NEVER ATTEMPT TO PULL THE NEWLY BORN FROM THE VAGINA BY THE LEGS OR TRUNK**
3. As soon as the legs are delivered, support the body wrapped in a towel.
4. After the shoulders are delivered, if face down, gently elevate the legs and trunk to facilitate delivery of the head.
5. Head should deliver in 30 seconds with the next contraction. If NOT, reach two gloved fingers into the vagina to locate the mouth, and push vaginal wall away from mouth to form an airway. Keep fingers in place and transport immediately. Alert receiving hospital ASAP.
6. Apply gentle pressure to the fundus. If head does NOT deliver in two minutes, keep your fingers in place to maintain the airway. Keep exposed part of the fetus warm and dry.
7. If the head delivers, anticipate newly born distress. Refer to **EMERGENCY CHILDBIRTH - PHASE III: CARE OF THE NEWLY BORN, p. 75**

### PROLAPSED CORD

2. Place mother in Trendelenburg position with knees-to-chest.
3. DO NOT push cord back into vagina.
4. Place gloved fingers into vagina between pubic bone and presenting part, with the cord in between two fingers to monitor cord pulsations and exert counter pressure on the presenting part.
5. Cover exposed cord with moist dressing and keep warm.
6. Maintain hand placement until relieved at Emergency Department.
PEDIATRIC INITIAL MEDICAL CARE

In this document, pediatric patients are defined as age 15 years and younger, consistent with the Emergency Medical Services and Trauma Center Code adopted by the Illinois Department of Public Health. Other terms commonly applied to the pediatric population include: "newly born" (less than 24 hours), "neonate" (1-28 days) and "infant" (1-12 months).

BLS / ALS

1. Assess scene safety
2. Use standard precautions
3. Assess Airway, Breathing and Circulation and intervene as indicated
4. Assess Level of Consciousness
5. Consider need for supplemental oxygen
   - If no distress, consider supplemental **OXYGEN AT LOW FiO₂** (blow-by method or nasal cannula)
   - If unstable or in distress, administer **HIGH FiO₂ BY MASK** or **ASSIST WITH HIGH FiO₂ BVM**
   - Consider nasal cannula waveform capnography for spontaneously breathing patients with respiratory distress and/or metabolic disorders
6. Obtain blood glucose if indicated
   - Treat hypoglycemia per **PEDIATRIC ALTERED MENTAL STATUS SOP**, p. 92
7. Assess ECG rhythm (if indicated and if available)
8. Assess pulse oximetry
9. If age > 1 year and patient is experiencing nausea or vomiting, consider administering **ZOFRAN** (ondansetron):
   - ≥ 40 kg: **ODT 4 mg tab** or **4 mg slow IV** x 1 dose only
   - < 40 kg: **0.1 mg/kg slow IV** x 1 dose only (no oral dose for < 40 kg)

Wong-Baker Pain Scale
## PEDIATRIC BRADYDYSRHYTHMIAS

### BLS / ALS

1. **Pediatric Initial Medical Care SOP, p. 79**
   - Complete initial assessment. Assess for:
     - Weak, thready or absent peripheral pulses
     - Decreasing consciousness
     - Tachypnea/Respiratory difficulty
     - Central cyanosis and coolness
     - Hypotension (late sign)
   - Search for and treat potentially reversible causes:
     - Hypovolemia
     - Hypoxia or ventilation problems
     - Hypoglycemia
     - Hypothermia
     - Toxins (overdose)
     - Tamponade (pericardial)
     - Tension pneumothorax

If cardiopulmonary compromise present:
2. Administer **HIGH FiO₂ BY MASK** or **SUPPORT WITH BVM VENTILATIONS**
3. If heart rate remains < 60 with hypoperfusion, **administer CPR**

### ALS

4. Establish **VASCULAR ACCESS IV/O**
5. If cardiopulmonary compromise continues, administer **EPINEPHRINE 1:10,000 0.1 mL/kg (0.01 mg/kg) IV/Io**. **Repeat every 3-5 minutes if no response.**
6. If increased vagal tone or primary AV block, administer **ATROPINE 0.02 mg/kg IV/Io**. Minimum dose 0.1 mg. Maximum single dose 0.5 mg.
   - **May repeat ATROPINE x 1 after 3-5 minutes**
7. If hypotension / hypoperfusion continues, administer **IV FLUID BOLUS of 20 mL/kg x 1**
   - **May REPEAT IV FLUID BOLUS x 2** to a total of 60 mL/kg if patient condition indicates
8. Contact Medical Control
9. Transport
   - Support ABCs
   - Keep warm
   - Observe

### Special Considerations:
- Hypoglycemia has been known to cause bradycardia in infants and children
- Hypothermia can cause bradycardia in infants and children. Refer to **PEDIATRIC COLD EMERGENCIES SOP, p. 102**
- Monitor IO fluid volumes carefully when using a pressure infuser
PEDIATRIC TACHYCARDIA  
(> 180 BPM for age 1-15, > 220 BPM for < 1 year)

1. Pediatric Initial Medical Care SOP, p. 79
   - Complete initial assessment. Assess for:
     - Weak, thready or absent peripheral pulses
     - Decreasing consciousness
     - Tachypnea/Respiratory difficulty
     - Central cyanosis and coolness
     - Hypotension (late sign)
   - Search for and treat potentially reversible causes:
     - Hypovolemia
     - Hypoxia or ventilation problems
     - Hypoglycemia
     - Hypothermia
     - Toxins (overdose)
     - Tamponade (pericardial)
     - Tension pneumothorax
     - Narrow QRS (≤ 0.08 sec) – Possible SVT
     - Unstable
     - Stable

BLS / ALS
2. Contact Medical Control
3. Transport
   - Support ABCs
   - Keep warm

ALS
2. Establish VASCULAR ACCESS IV/IO
3. If probable SVT, give ADENOCARD (adenosine) 0.1 mg/kg rapid IV/IO push (max dose 6 mg) ▲
5. If no conversion, repeat ADENOCARD (adenosine) at 0.2 mg/kg rapid IV/IO push (max dose 12 mg) ▲
6. If ADENOCARD (adenosine) unsuccessful and patient remains unstable:
   - Begin transport, and contact Medical Control
     - SYNCHRONIZED CARDIOVERSION 1 J/kg while enroute
     - If no response, may repeat SYNCHRONIZED CARDIOVERSION 2 J/kg
     - Consider sedation with VERSED (midazolam) 0.1 mg/kg slow IV/IO or 0.2 mg/kg IN (maximum dose 6 mg < 5 years, 10 mg ≥ 5 years), but don’t delay cardioversion
PEDIATRIC TACHYCARDIA
(> 180 BPM for age 1-15, > 220 BPM for < 1 year)

Wide QRS (> 0.08 sec) – Possible VT
Unstable

**ALS**
2. Establish VASCULAR ACCESS IV/IO
3. SYNCHRONIZED CARDIOVERSION at 1 J/kg
   - Consider sedation with VERSED (midazolam) 0.1 mg/kg slow IV/IO or 0.2 mg/kg IN (maximum dose 6 mg < 5 years, 10 mg ≥ 5 years), but don’t delay cardioversion
4. If no conversion, administer SYNCHRONIZED CARDIOVERSION at 2 J/kg
5. If no conversion, consider ADENOCARD (adenosine) 0.1 mg/kg rapid IV/IO push ▲
6. Begin transport and contact Medical Control

**Differential diagnosis of narrow complex rhythms in pediatrics**

</tbody>
</table>

**Special Considerations:**
- If injury or neck/back trauma suspected, consider **Spinal Motion Restriction**
- Remove patient from hazardous environment or standing water prior to use of AED
- If AED In place, EMS personnel should let AED complete rhythm analysis prior to switching from AED to manual defibrillator (switch during CPR interval)
**PEDIATRIC PULSELESS ARREST**

**BLS / ALS**
1. *Pediatric Initial Medical Care SOP, p. 79*
2. Initiate CPR at rate of 100-120 compressions per minute
   - Single rescuer – 30:2
   - Two rescuers – 15:2
3. Check cardiac rhythm
   - If BLS, go to *PEDIATRIC AED SOP, p. 83*

**SHOCKABLE RHYTHM**

**ALS:**
4. Shock x 1 at 2 J/kg and immediately resume CPR for 2 minutes
5. Recheck rhythm.
   - If organized electrical rhythm, check pulse. If no pulse or heart rate < 60 BPM, resume CPR.
   - If shockable rhythm, resume CPR while defibrillator charging. When defibrillator ready, SHOCK X 1 at 4 J/kg and resume CPR for 2 minutes.
6. Establish VASCULAR ACCESS IV/IO, consider INTUBATION / ADVANCED AIRWAY INSERTION.
7. Administer EPINEPHRINE 1:10,000 0.1 mL/kg (0.01 mg/kg) IV/IO ♥ while continuing CPR
   - Repeat every 3 to 5 minutes
8. Repeat cycle of 2 minute CPR and rhythm recheck. DEFIBRILLATE at 4 J/kg when indicated by shockable rhythm.
9. Transport

**NON-SHOCKABLE RHYTHM**

**ALS:**
4. Resume CPR immediately for 2 minutes
5. Recheck rhythm.
   - If organized electrical rhythm, check pulse. If no pulse or heart rate < 60 BPM, resume CPR.
   - If shockable rhythm occurs at any time, switch to that treatment column
6. Establish VASCULAR ACCESS IV/IO, consider INTUBATION / ADVANCED AIRWAY INSERTION.
7. Administer EPINEPHRINE 1:10,000 0.1 mL/kg (0.01 mg/kg) IV/IO ♥ while continuing CPR
   - Repeat every 3 to 5 minutes
8. Re-verify rhythm every 2 minutes. If organized electrical rhythm or rhythm change, check pulse.
9. Transport

**Special Considerations:**
- Search for and treat potentially reversible causes:
  - Hypovolemia
  - Hypoxia or ventilation problems
  - Hypoglycemia
  - Hypothermia
  - Toxins (overdose)
  - Tamponade (cardiac)
  - Tension pneumothorax
  - Trauma (hypovolemia, increased intracranial pressure)
- If advanced airway is placed, give continuous chest compressions without pause for breaths. After 2 minutes of CPR, recheck rhythm. If organized and non-shockable rhythm, check pulse.
- Defibrillation energy should not exceed adult energy.
- ♥ If no vascular access, may consider EPINEPHRINE 1:1000 0.1 mL/kg (0.1 mg/kg) ET diluted with 2 mL normal saline.
PEDIATRIC DRUG ASSISTED INTUBATION - VERSED

ALS

1. **Pediatric Initial Medical Care SOP, p. 79**
   - The following are situations which may require the use of this SOP to facilitate intubation:
     - Pediatric Glasgow Coma Scale (PCGS) score ≤ 8
     - Imminent respiratory arrest or imminent tracheal / laryngeal closure from any cause

   **ALWAYS HAVE CRICOTHYROIDOTOMY EQUIPMENT AVAILABLE**

2. Prepare patient and equipment for procedure
   - Position patient in sniffing position unless cervical spine injury suspected
   - Have suction with Yankauer or other rigid tip ready
   - Prepare all intubation and cricothyroidotomy equipment per System-specific procedure
   - **HIGH FiO2 VENTILATION** prior to and in-between steps of this procedure as able

3. Administer **VERSED** (midazolam) 0.1 mg/kg slow IV/IO or 0.2 mg/kg IN/IM q 2 minutes to a maximum total dose of 6 mg < 5 years, 10 mg ≥ 5 years

4. **BENZOCAINE spray** to posterior pharynx (0.5-1 second spray x 2, 30 seconds apart)

5. Attempt oral or oral in-line intubation via System-specific procedure

6. After passing of tube, verify placement:
   - Adequate chest expansion bilaterally and symmetrically
   - Positive bilateral breath sounds
   - Negative epigastric sounds
   - Waveform capnography, end tidal CO2 detector and/or esophageal detection device per System-specific procedure

7. Secure ET tube and reassess placement

**POST INTUBATION SEDATION**

8. Administer **VERSED** (midazolam) 0.1 mg/kg slow IV/IO or 0.2 mg/kg IN q 2 minutes to a maximum total dose 6 mg < 5 years, 10 mg ≥ 5 years, including initial sedation)

If unsuccessful, continue **HIGH FiO2 VENTILATION**, contact Medical Control, and be prepared for CRICOIDTHYROIDOTOMY per System-specific procedure.
# PEDIATRIC RESPIRATORY ARREST

## BLS / ALS

1. **Pediatric Initial Medical Care SOP, p. 79**
2. Perform appropriate airway maneuver
   - Modified jaw thrust or chin lift/head tilt
   - Suction
   - Oropharyngeal airway
3. Consider **Spinal Motion Restriction** as indicated.
4. If foreign body suspected:
   - Open mouth and remove foreign body if visible
   - Reposition airway
   - Consider back slaps / abdominal thrusts (age-dependent)
5. If not breathing **ASSIST WITH HIGH FiO₂ BVM**
   - Consider airway insertion
6. Chest rise inadequate
   - Reposition airway
   - Consider airway insertion

## BLS

7. Cardiopulmonary compromise
   - Refer to **PEDIATRIC SHOCK SOP, p. 95**, **PEDIATRIC AED SOP, p. 83**, or **PEDIATRIC PULSELESS ARREST SOP, p. 84**, as appropriate
   - If heart rate < 60 BPM, go to **PEDIATRIC BRADYDYSRHYTHMIAS SOP, p. 80**

## ALS

7. Cardiopulmonary compromise
   - Establish **VASCULAR ACCESS IV/IO** at rate of 20 mL/hr
   - Refer to **PEDIATRIC SHOCK SOP, p. 95** or **PEDIATRIC PULSELESS ARREST SOP, p. 84**
   - If heart rate < 60 BPM, go to **PEDIATRIC BRADYDYSRHYTHMIAS SOP, p. 80**
8. Consider **INTUBATION / ADVANCED AIRWAY INSERTION**
9. Consider **AGE-APPROPRIATE CRICOTHYROIDOTOMY**

## SPECIAL CONSIDERATIONS:

- Respiratory arrest may be a presenting sign of a toxic ingestion, metabolic disorder or anaphylaxis
- Consider **NARCAN** (naloxone) or **GLUCOSE** as indicated
PEDIATRIC RESPIRATORY DISTRESS

**BLS / ALS**
1. Pediatric Initial Medical Care SOP, p. 79
2. Complete primary and secondary assessment.
   - Assess for signs of:
     - **Complete Airway Obstruction**
       - suspected foreign body
       - obstruction or epiglottitis
       - anaphylaxis
     - **Partial Airway Obstruction**
       - suspected foreign body
       - obstruction or epiglottitis
       - anaphylaxis
       - stridor
       - history of choking episode
       - drooling
       - hoarseness
       - retractions
       - tripod position
     - **Reactive Airway Disease**
       - wheezing
       - grunting
       - retractions
       - tachypnea
       - diminished respirations
       - decreased breath sounds
       - tachycardia / bradycardia
       - decreasing consciousness
   - Refer to PEDIATRIC RESPIRATORY DISTRESS WITH A TRACHEOSTOMY SOP, p. 89, as indicated

**Complete Airway Obstruction**

**BLS / ALS**
3. If foreign body suspected, open mouth and remove foreign body if visible
4. Reposition airway
5. Consider back slaps, chest/abdominal thrusts (age dependent)

**ALS**
6. Direct laryngoscopy, foreign body removal with Magill forceps if indicated
7. Secure airway as appropriate
8. Consider AGE-APPROPRIATE CRICOTHYROIDOTOMY

**Partial (Upper) Airway Obstruction**
3. Avoid any agitation
4. Position of comfort
5. Consider alternate oxygen methods, i.e. blow by oxygen
6. If wheezing, consider:
   - **BLS**: assist patient with prescribed beta-agonist MDI if available
   - **ALS**: administer ALBUTEROL (2.5 mg) via nebulizer
7. If cyanosis or other signs of respiratory insufficiency:
   - **ALS**: administer EPINEPHRINE 1:1000 3 mg (3 mL) via nebulizer
8. DO NOT attempt intubation, invasive glottic visualization, or venous access
## PEDIATRIC RESPIRATORY DISTRESS

### Reactive (Lower) Airway Disease

3. Position of comfort
   - **BLS**: assist patient with prescribed beta-agonist MDI if available
   - **ALS**: administer ALBUTEROL (2.5 mg) via nebulizer

4. Reassess. If no response to ALBUTEROL or patient in severe respiratory distress:

   **EPINEPHRINE 1:1000 IM**
   - ≤ 10 kg = 0.1 mg (0.1 mL)
   - 11-20 kg = 0.2 mg (0.2 mL)
   - ≥ 20 kg = 0.3 mg (0.3 mL)

### Special Considerations

- If stable croup is suspected, consider NORMAL SALINE 6 mL nebulizer by mask or aim mist (blow by) at child’s face
- If assisting patient with a beta-agonist MDI, it should be administered through a holding chamber or spacer device, if available. Beta-agonist MDI inhalers include, among others, albuterol (Proventil®, Ventolin®) and levalbuterol (Xopenex®).
## PEDIATRIC RESPIRATORY DISTRESS WITH A TRACHEOSTOMY TUBE

### BLS / ALS
1. **Pediatric Initial Medical Care SOP, p. 79**
2. **ADMINISTER HIGH FiO₂ per tracheostomy collar**
   - Suction and reassess airway adequacy
   - If still obstructed, repeat suction, after removing inner cannula if present
   - Still obstructed, have caregiver change trach tube, or insert appropriately sized ET tube into stoma
   - Reassess airway adequacy
3. **If adequate airway:** **HIGH FiO₂ BY MASK or ASSIST WITH HIGH FiO₂ BVM**
   - Perform frequent reassessment for obstruction:
     - Retractions
     - Grunting/wheezing/stridor
     - Tachypnea
     - Decreasing consciousness
     - Apnea
     - Cyanosis
4. **Continued Obstruction:**
   - **VENTILATE** with **HIGH FiO₂** using bag valve to trach tube
   - If unable to ventilate to trach tube, ventilate with BVM to mouth (cover stoma)
   - If no chest rise, ventilate with BVM (infant mask) to stoma
   - Chest must rise and fall with each ventilation

### BLS
5. Refer to **PEDIATRIC RESPIRATORY ARREST SOP, p. 86**, or **PEDIATRIC PULSELESS ARREST SOP, p. 84**, as indicated.
6. Contact Medical Control and consider ALS backup if available

### ALS
5. If wheezing, consider **ALBUTEROL 2.5 mg (3 mL) via nebulizer**
6. Refer to **PEDIATRIC RESPIRATORY ARREST SOP, p. 86**, or **PEDIATRIC PULSELESS ARREST SOP, p. 84**, as indicated.

### For Transport BLS/ALS:
- Support ABCs
- Observe
- Keep warm
- Transport in position of comfort
- Consider allowing caregiver to remain with child regardless of child’s level of responsiveness

### Special Considerations
- If chest rise inadequate:
  - Reposition the airway
  - If using mask to stoma, consider inadequate volume delivered. Compress bag further and/or depress pop-off valve.
# PEDIATRIC RESPIRATORY DISTRESS WITH A VENTILATOR

## BLS / ALS
1. Pediatric Initial Medical Care SOP, p. 79
2. Open airway
3. Remove patient from ventilator and **VENTILATE** with **HIGH FiO₂** using bag valve to tracheostomy tube

**Able to Ventilate**
4. Contact Medical Control (if BLS, consider ALS backup)
5. Transport
   - Support ABCs
   - Observe
   - Keep warm

**Unable to Ventilate**
6. Go to **PEDIATRIC RESPIRATORY DISTRESS WITH A TRACHEOSTOMY TUBE SOP**, p. 89, for obstructed airway guidelines

## Special Considerations
- Consider using parent / caregivers / home health nurses as medical resources at home and enroute
- Consider alerting Medical Control of parent / caregiver participation in care
- Consider allowing caregiver to remain with child regardless of child’s level of responsiveness
- Bring ventilator to the hospital or have parents/caregivers bring the ventilator to the hospital
# PEDIATRIC ALLERGIC REACTION / ANAPHYLAXIS

## BLS / ALS
1. Pediatric Initial Medical Care SOP, p. 79
2. Apply ice/cold pack to bite or injection site
3. BLS: consider the administration of one dose **EPINEPHRINE auto-injector** (EpiPen®)
4. BLS: consider assisting with patient prescribed Beta-agonist inhaler (albuterol, Proventil, etc.) if available

## ALS

### Localized allergic reaction
without systemic symptoms – urticarial, hives or edema NOT involving mouth, lips or airway

5. Administer **BENADRYL** (diphenhydramine) 1 mg/kg IM or slow IV. Max dose 50 mg.

### Allergic reaction with systemic signs
wheezing, diffuse hives, or prior history of systemic reaction, **without signs of hypoperfusion**

5. Administer **EPINEPHRINE 1:1000 IM**
   - ≤ 10 kg = 0.1 mg (0.1 mL)
   - 11 – 20 kg = 0.2 mg (0.2 mL)
   - ≥ 20 kg = 0.3 mg (0.3 mL)
6. If wheezing, consider **ALBUTEROL 2.5 mg (3 mL) via nebulizer**
7. May **REPEAT EPINEPHRINE q 15 min** as symptoms persist
8. Administer **BENADRYL** (diphenhydramine) 1 mg/kg IM or slow IV/IO. Max dose 50 mg.

### Anaphylaxis: multisystem reaction with signs of hypoperfusion
altered mental status or severe respiratory distress / wheezing / hypoxia

5. **IV FLUID BOLUS** of 20 mL/kg
   - May **REPEAT IV FLUID BOLUS x 2** to a total of 60 mL/kg if patient condition indicates
6. Administer **EPINEPHRINE 1:10,000 0.1 mL/kg (0.01 mg/kg) IV/IO**
   - May repeat q 5 minutes
   - If no vascular access, give **EPINEPHRINE 1:1000 0.01 mL/kg (0.01 mg/kg) IM**.
7. Administer **BENADRYL** (diphenhydramine) 1 mg/kg slow IV/IO. Max dose 50 mg. If no vascular access, give IM.
8. If wheezing, consider **ALBUTEROL 2.5 mg (3 mL) via nebulizer**
   - If severe or continued wheezing, repeat ALBUTEROL to provide continuous treatments
PEDIATRIC ALTERED MENTAL STATUS
PEDIATRIC DIABETIC HYPOGLYCEMIA

**BLS/ALS**
1. Pediatric Initial Medical Care SOP, p. 79
   - Spinal Motion Restriction as indicated
   - Consider other causes of altered mental status and treat per appropriate SOP
   - Assess respiratory effort
2. Obtain and record blood glucose level

**ALS**
3. Establish VASCULAR ACCESS IV/IO
4. If blood glucose ≤ 60, administer:
   - DEXTROSE
     - > 8 years: D50% 2 mL/kg IV/IO
     - 1-8 years: D25% 2 mL/kg IV/IO
     - 1-12 months: D12.5% 4 mL/kg IV/IO
     - Neonate (1-28 days): D12.5% 2 mL/kg IV/IO
     - Newly born (<24 hours): D12.5% 2 mL/kg IV/IO
     OR
   - GLUCAGON
     - > 8 years: 1 mg IM
     - ≤ 8 years: 0.5 mg IM
5. Reassess respiratory effort. If inadequate, administer: NARCAN (naloxone) 2 mg IV/IO/IM/IN
6. If no response to NARCAN (naloxone), secure the airway as appropriate

**Special Considerations**
- > 8 years: During critical drug shortages of dextrose 50%, administer DEXTROSE 10% 5 mL/kg (0.5 g/kg, max 25 g) slow IV.
- If patient remains hypoglycemic and symptomatic 5 minutes after initial dose, repeat DEXTROSE 10% 5 mL/kg (0.5 g/kg, max 25 g) slow IV.

- Consider causes:
  - A Alcohol, Abuse
  - E Epilepsy, Electrolytes, Encephalopathy
  - I Insulin
  - O Opiates, Overdose
  - U Uremia
  - T Trauma, Temperature
  - I Infection, Inborn errors
  - P Psychogenic
  - P Poison
  - S Shock, Seizures, Stroke, Space-occupying lesion, Subarachnoid hemorrhage, Shunt
### PEDIATRIC APPARENT LIFE-THREATENING EVENT (ALTE)

**History of any of the following:**
- Apnea
- Loss of consciousness
- Color change
- Loss of muscle control
- Episode of choking or gagging

**Important information to relay to Medical Control and document:**
- Parental / caregiver actions at the time of the event
- What resuscitative measures were taken

The typical age for such events is 2 years or less, and is most commonly seen in infants under 12 months. An ALTE is an event that is frightening to the observer and usually involves some combination of the above symptoms. It may present as a symptom of a variety of pediatric conditions including seizures, upper airway compromise, gastroesophageal reflux, metabolic problems, anemia and cardiac disease.

### BLS/ALS

1. **Pediatric Initial Medical Care SOP, p. 79**
   - Support ABC’s
   - Perform a complete secondary assessment including:
     - General appearance
     - Work of breathing
     - Circulation to skin
     - Evidence of trauma
     - Extent of interaction with the environment
     - NOTE: Exam may be normal by the time of patient contact with EMS
   - Treat any reversible causes identified, including blood glucose abnormalities, per appropriate SOP
   - **All ALTE patients should be transported for medical evaluation, even the well appearing child**

2. Transport
   - Support ABCs
   - Observe
   - Keep warm
ILLINOIS REGION 8 EMERGENCY MEDICAL SERVICES
CENTRAL Dupage, Edward, Good Samaritan, Loyola EMS Systems
STANDARD OPERATING PROTOCOLS

**PEDIATRIC SEIZURES / STATUS EPILEPTICUS**
Non-traumatic origin

**BLS/ALS**
- **Pediatric Initial Medical Care SOP**, p. 79
- Clear and protect airway. Vomiting/aspiration precautions.
- Protect the patient from injury. Do not place anything in mouth if seizing.
- Position patient on side unless contraindicated
- Obtain and record blood glucose level, if available. If < 60, treat per **PEDIATRIC ALTERED MENTAL STATUS SOP**, p. 92.

**IF ACTIVELY SEIZING:**

**ALS**
- Administer **VERSED** (midazolam):
  - **VERSED** (midazolam) 0.1 mg/kg slow IV/IO
  - OR
  - **VERSED** (midazolam) 0.2 mg/kg IN/IM
  - Maximum **VERSED** (midazolam) dose 6 mg < 5 years, 10 mg ≥ 5 years
  - If seizures continue for > 5 minutes, administer **VERSED** (midazolam) 0.1 mg/kg slow IV/IO or 0.2 mg/kg IN/IM q 2 minutes up to a maximum dose of 6 mg < 5 years, 10 mg ≥ 5 years unless otherwise ordered by Medical Control.
  - Monitor airway for need for airway insertion / intubation.

**FEBRILE SEIZURES:**
- Cool patient by removing clothing. Place towel or sheet moistened with tepid (room temperature) water over patient and fan the child. DO NOT induce shivering. DO NOT rub with alcohol or place in cold/ice water.
- Give nothing by mouth

**ALS ONLY – Use of patient prescribed DIASTAT® (rectal Valium)**
1. Trained paramedics may administer **DIASTAT® (rectal Valium)** to patients:
   - The patient should be actively seizing for > 3 minutes, or having repeated seizures without regaining consciousness, i.e. status epilepticus.
   - The identity of the patient and the name on the prescription must match.
   - The paramedic may assist and or administer **DIASTAT®** at the dose prescribed.
   - If any of these criteria are not met, follow regular **PEDIATRIC SEIZURES / STATUS EPILEPTICUS SOP**, p. 94
2. Transport all patients who received this medication; if consent for transport is refused by parent/guardian/power of attorney for health care, contact Medical Control.
3. Call Medical Control for assistance with any refusals.

**Note:** If suspected that seizure is secondary to opioid overdose, see **PEDIATRIC TOXICOLOGIC EMERGENCIES SOP**, p. 96
# PEDIATRIC SHOCK

## BLS / ALS
1. Pediatric Initial Medical Care SOP, p. 79
2. Supine position
3. Control bleeding as appropriate

## ALS
4. Secure airway as appropriate

## Obstructive Shock (Tension Pneumothorax)
5. PLEURAL DECOMPRESSION

## Distributive Shock (Suspected Sepsis)
5. Establish VASCULAR ACCESS IV/IO
6. Administer IV FLUID BOLUS of 20 mL/kg
7. If suspected allergic reaction, refer to PEDIATRIC ALLERGIC REACTION / ANAPHYLAXIS SOP, p. 91
8. If no response to initial fluid bolus, repeat IV fluid bolus of 20 mL/kg. May repeat x 2 to a maximum of 60 mL/kg.

## Cardiogenic Shock (Congenital Heart Disease / Cardiac Surgery / Post-Cardiac Arrest)
5. Establish VASCULAR ACCESS IV/IO
6. Treat any cardiac rhythm disturbance per appropriate SOP
7. Consider IV FLUID BOLUS of 20 mL/kg
   - Caution: fluids may need to be restricted in cardiogenic shock

## Hypovolemic Shock (Suspected Dehydration/Volume Loss/Hemorrhagic Shock)
5. Establish VASCULAR ACCESS IV/IO
6. Administer IV FLUID BOLUS of 20 mL/kg
7. If no response to initial fluid bolus, repeat IV fluid boluses of 20 mL/kg. May repeat x 2 to a maximum of 60 mL/kg.
PEDIATRIC TOXICOLOGIC EMERGENCIES

BLS/ALS

STABLE: alert, normotensive

1. Pediatric Initial Medical Care SOP, p. 79
   • HazMat precautions
   • Do not initiate vomiting

BLS

2. Contact Medical Control
3. Initial interventions per Medical Control as indicated for identified exposure
4. For altered level of consciousness or seizures, refer to appropriate SOP
5. Bring container(s) of drug or substance to the ED
6. Transport
   • Support ABCs
   • Observe
   • Keep warm

BLS / ALS

UNSTABLE: altered mental status, airway compromise, and/or hypoperfusion

1. Pediatric Initial Medical Care SOP, p. 79
   • HazMat precautions
   • Do not initiate vomiting

For known or suspected OPIOID OVERDOSE or unknown etiology with respiratory compromise:

2. Protect airway, HIGH $\text{FiO}_2$ or VENTILATION
3. Consider NARCAN (naloxone):
   - **BLS**
     - 2 mg IN
   - **ALS**
     - $\leq 20 \text{ kg}$: 0.1 mg/kg IV/IN/IO/IM up to a maximum of 2 mg
     - $> 20 \text{ kg}$: 2 mg IV/IN/IO/IM

ALS

- PGCS score $\leq 8$ and evidence of airway compromise: **CONSIDER INTUBATION / ADVANCED AIRWAY INSERTION.**
- Consider delaying intubation if known opioid exposure.
- The use of Alternate Airway is contraindicated if ingestion of caustic substance.
PEDIATRIC TOXICOLOGIC EMERGENCIES

CYCLIC ANTIDEPRESSANT / SODIUM CHANNEL BLOCKER OVERDOSE
Hypoperfusion associate with wide QRS complex (possible cyclic ingestion)

2. Administer IV FLUID BOLUS of 20 mL/kg in increments
3. Administer SODIUM BICARBONATE 8.4% 1 mEq/kg IV

BETA-BLOCKER / CALCIUM CHANNEL BLOCKER OVERDOSE
Hypoperfusion associated with bradycardia (possible beta blocker or calcium channel blocker ingestion)

2. Administer GLUCAGON 0.5 mg IV/IO. May repeat x 1

</table>

2. **Ensure scene safety** – If necessary, mitigate any hazardous materials and/or chemicals that may impair or endanger the rescuer prior to treatment

3. If available, administer **HYDROXOCOBALAMIN (CYANOKIT®)** 70 mg/kg (reconstituted solution is 25 mg/mL)

4. If hypotensive or pulseless, **IV FLUID BOLUS of 20 mL/kg**
   If no response to initial fluid bolus, **repeat IV FLUID BOLUS of 20 mL/kg**. May repeat **up to total infusion of 60 mL/kg**

## CARBON MONOXIDE POISONING

- **HIGH FiO₂ BY MASK or ASSIST WITH HIGH FiO₂ BVM**
- Do not rely on pulse oximetry
- Keep patient as quiet as possible to minimize tissue oxygen demand

## SUSPECTED CLUB DRUG OVERDOSE

2. Contact Medical Control for suspected use of club drugs
Drugs Commonly Seen in Overdose / Poisoning

**Opioids**
Morphine, Demerol (meperidine), heroin, methadone, codeine, Duragesic (fentanyl), Vicodin/Lortab (APAP and hydrocodone), hydrocodone, Dilauidid (hydromorphone), Percocet (oxycodone and APAP), OxyContin (oxycodone)

**Sodium Channel Blockers**
Benadryl (diphenhydramine), Dilantin (phenytoin)

**Cyclic Antidepressants**
Elavil (amitriptyline), Norpramin (desipramine), Tofranil (imipramine), Pamelo (nortriptyline), Sinequan (doxepine)

**Benzodiazepines**
Halcion (triazolam), Ativan (lorazepam), Restoril (temazepam), Versed (midazolam), Valium (diazepam), Xanax (alprazolam), Librium (chlordiazepoxide), Klonopin (clonazepam), Dalmane (flurazepam), Rohypnol (flunitrazepam), Ambien (zolpidem)

**Beta Blockers:**
Inderal (propranolol), Corgard (nadolol), Lopressor (metoprolol), Tenormin (atenolol), timolol

**Calcium Channel Blockers:**
Cardizem (diltiazem), Procardia (nifedipine), Calan/Adalat/Isoptin (verapamil), Norvasc (amlodipine)

**Club Drugs**
GHB (Liquid G, Liquid Ecstasy), ketamine (Special K, Vitamin K, Super K), MDMA (Ecstasy, XTC, ADAM, E), Foxy Methoxy, AMT, Coricidin (Triple-C)

Poison Control Center 1-800-222-1222

<td>4mg Atropine</td>
</tr>
</tbody>
</table>

* Appropriate dose Atropine auto injector can be used if available
† 2 PAM=Pralidoxime

**NOTES:**

For nerve agents the doses are:
- Atropine dose 0.05 mg/kg
- 2 PAM† dose 25 mg/kg

For children > 3 yrs with severe symptoms:
- 1 Mark I Kit will give 0.08 — 0.13 mg/kg Atropine
- 24-46 mg/kg 2 PAM†

2 PAM† solution can be prepared from the vial containing 1 gram of dessicated 2 PAM†. Inject 3 ml of NS or sterile water into the vial and shake well. This results in 3.3 ml of 300 mg/ml.

PEDIATRIC HEAT EMERGENCIES

BLS/ALS

1. Pediatric Initial Medical Care SOP, p. 79
   - Complete Secondary Assessment:
     - Hot, dry, flushed or ashen skin
     - Tachycardia
     - Tachypnea
     - Diaphoresis
     - Decreasing consciousness
     - Headache
     - Weak, thready or absent peripheral pulse
     - Hypotension
     - Profound weakness / fatigue
     - Vomiting
     - Muscle cramps

2. Assess scene for environmental risks to patient and rescuers
3. Place patient in cool environment and remove clothing as appropriate
4. Apply cool packs to axilla and groin

<table>
<thead>
<tr>
<th>Altered Mental Status</th>
<th>Normal Mental Status</th>

</tbody>
</table>

- Support ABC’s
- Give cool liquids by mouth if no nausea / vomiting (age dependent)
- Observe
- Transport
# PEDIATRIC COLD EMERGENCIES

## BLS/ALS

1. **Pediatric Initial Medical Care SOP, p. 79**
   - Complete Secondary Assessment

   **Hypothermia Signs & Symptoms**
   - Pt complains of cold
   - Shivering
   - Decreased respiratory rate
   - Dypsrythmias
   - Dilated, sluggish pupils
   - Decreased reflexes
   - May mimic death

   **Signs of Cardiopulmonary Compromise**
   - Weak, thready or absent peripheral pulse
   - Decreasing consciousness
   - Tachypnea/respiratory difficulty
   - Central cyanosis and coolness
   - Hypotension (late sign)

2. Place patient in warm environment. Remove wet clothing. Prevent further heat loss.

### No Cardiopulmonary Compromise

3. Warm trunk
4. Place heat packs to axilla and groin, taking care to avoid direct skin contact

### Cardiopulmonary Compromise

3. Support with BVM ventilations as indicated; secure airway as appropriate
4. Avoid unnecessary manipulation and rough handling
5. Perform chest compressions if pulseless

<table>
<thead>
<tr>
<th>BLS</th>
<th>ALS</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Consider AED if available</td>
<td>- For VF or pulseless VT consider DEFIBRILLATION at 2 J/kg</td>
</tr>
<tr>
<td>- If advised, give <strong>ONE SHOCK ONLY</strong></td>
<td>- Give <strong>ONE SHOCK ONLY</strong>, then resume CPR</td>
</tr>
<tr>
<td>- Resume CPR, do not re-analyze rhythm</td>
<td>- Do not re-analyze rhythm or give any additional shocks</td>
</tr>
</tbody>
</table>

6. Refer to appropriate SOP as indicated
7. Warm trunk. Place heat packs to axilla and groin, taking care to avoid direct skin contact
8. **ALS**: Establish **VASCULAR ACCESS IV/IO**
9. Contact Medical Control
10. Transport
    - Support ABCs
    - Observe
    - Keep warm
# PEDIATRIC INITIAL TRAUMA CARE (PITC)

## BLS / ALS

1. If a potential crime scene, make efforts to preserve integrity of potential evidence
2. Anticipate potential injuries based on the mechanism of energy transfer
3. **AIRWAY/C-SPINE:** Spinal Motion Restriction as indicated. Position for optimal airway and suction as needed.
4. **BREATHING/VENTILATION:** Assess ventilations and respiratory effort; expose chest as needed:
   - **If inadequate ventilation, respiratory effort**
     - Open airway using modified jaw thrust
     - Relieve upper airway obstruction as indicated
     - **VENTILATE WITH HIGH FiO₂** via BVM
     - Consider need for advanced airway placement
       - If PGCS score ≤ 8, **INTUBATE** using in-line procedure
       - Refer to PEDIATRIC DRUG ASSISTED INTUBATION - VERSED SOP, p. 85, if indicated
   - **If adequate ventilation / respiratory effort**
     - Auscultate breath sounds
     - Administer oxygen:
       - **SUPPLEMENTAL OXYGEN** via nasal cannula or blow-by method
       - If altered mental status, hemodynamically unstable, or meets Trauma Region Field Triage Criteria, **increase OXYGEN TO HIGH FiO₂** (increase LPM flow or use mask)

## CIRCULATION / PERFUSION:

- Assess central and peripheral pulses, circulation to skin
- Assess type, amount and source(s) of hemorrhage
- Apply direct pressure, pressure dressings to control hemorrhage
- Consider **TOURNIQUET** for extremity injury; do not release once applied, note time applied

5. Complete initial assessment, including:
   - Pediatric Trauma Score
   - Pediatric Glasgow Coma Scale (PCGS)
# PEDIATRIC INITIAL TRAUMA CARE (PITC)

If adequate ventilation, respiratory effort, or ventilations being provided as above

- Control hemorrhage
- Splint or immobilize injuries as indicated and time permits

## ALS

7. Establish **VASCULAR ACCESS IV/IO**
8. Administer **IV FLUID BOLUS** of 20 mL/kg
9. Reassess perfusion. May repeat **IV FLUID BOLUS** of 20 mL/kg x 2 up to total of 60 mL/kg as indicated.
10. If unable to maintain airway with manual methods, consider intubation or age-appropriate cricothyroidotomy. **Do not delay transport to attempt invasive airway.**

## If Cardiopulmonary Compromise

- Refer to **PEDIATRIC SHOCK SOP**, p. 95 or **PEDIATRIC PULSELESS ARREST SOP**, p. 84

## If Seizure Activity

- Refer to **PEDIATRIC SEIZURE / STATUS EPILEPTICUS SOP**, p. 94

## Suspected Spine Injury / Suspected Neurogenic Shock

11. If patient remains hypoperfused and remains bradycardic, consider **ATROPINE 0.02 mg/kg rapid IV/IO**. Minimum dose 0.1 mg. Maximum single dose 0.5 mg.
   - May repeat **ATROPINE q 3 minutes x 2**. Maximum total dose 1.5 mg.

## Chest Injury

11. If sucking chest wound, apply occlusive dressing / chest seal per System-specific procedure
12. If suspected tension pneumothorax, **PLEURAL DECOMPRESSION** of affected side

## Musculoskeletal Injuries

11. Consider analgesia, if patient hemodynamically stable:
   - Mild Pain: **NITROUS OXIDE** if available, per System-specific procedure
   - Moderate to Severe Pain: Administer **FENTANYL 1 mcg/kg SLOW IV or IO/IM/IN**, no repeat dose. Max dose 100 mcg. Immobilize and/or splint. Monitor extremity perfusion. Elevate extremity and/or apply cold pack after splinting when appropriate.
12. If long bone fracture with displacement / spasm, and hemodynamically stable, consider administration of:
   - **VERSED (midazolam) 0.1 mg/kg slow IV/IO or IN q 2 minutes** to a maximum dose of 6 mg < 5 years, 10 mg ≥ 5 years
   - If no other route, **VERSED (midazolam) 0.2 mg/kg IM x 1** in unaffected limb.
Amputation / Degloving Injuries
11. Stabilize with bulky dressing.
12. If uncontrolled bleeding continues, apply tourniquet above amputation as close as possible to the injury. Note time tourniquet applied. DO NOT release tourniquet once it has been applied.
13. Care of amputated parts:
   - Wrap in normal saline moistened gauze or towel. Place in plastic bag and seal. DO NOT immerse tissue directly in water or saline
   - Place plastic bag in second container filled with ice or cold water or place on cold packs and bring with patient to the hospital

Signs of Cardiopulmonary Compromise

- Tachycardia
- Weak, thready or absent peripheral pulse
- Decreasing consciousness
- Tachypnea/Respiratory difficulty
- Central cyanosis and coolness
- Hypotension (late sign)
- Bradycardia and/or no palpable BP (ominous sign)
## PEDIATRIC HEAD TRAUMA

### BLS / ALS

1. **Pediatric Initial Trauma Care SOP, p. 104-106**
   - Maintain supine position
   - Consider *Spinal Motion Restriction* as indicated
   - Assess Pediatric Glasgow Coma Scale (PGCS)
   - **BLS**: Contact Medical Control

PEDIATRIC BURNS (THERMAL, ELECTRICAL, CHEMICAL)

BLS / ALS
1. Assess scene safety
   - Remove patient to safety
   - Use standard precautions
2. Pediatric Initial Trauma Care SOP, p. 104-106
   - Stop the burning process
   - Complete primary assessment, assess for:
     - Stridor
     - Wheezing
     - Grunting
     - Decreased respirations or apnea
     - Retractions
     - Carbonaceous sputum
     - Tachypnea
     - Decreasing consciousness
   - Assess percentage / depth of burn
   - Remove constricting jewelry and clothes

Thermal Burns
3. Establish VASCULAR ACCESS

<table>
<thead>
<tr>

<td>250mL/hr</td>
</tr>
<tr>
<td>&gt;14 y/o</td>
<td>500mL/hr</td>
</tr>
</tbody>
</table>

4. Calculate TBSA (do not include 1st degree burns in calculation)
5. Cover burn wound with DRY dressings or clean sheets
6. Obtain glucose and treat per PEDIATRIC ALTERED MENTAL STATUS SOP, p. 92
7. Place patient on clean sheet on stretcher and cover patient with dry clean sheets and blanket to maintain body temperature.
8. Refer to PEDIATRIC SHOCK SOP, p. 95 as indicated.
9. Contact Medical Control
10. Transport
    - Support ABCs
    - Observe
    - Keep warm
**Inhalation Burns**
3. Consider need for **SPINAL MOTION RESTRICTION**
4. Monitor cardiac rhythm and treat according to appropriate SOP
5. Assess neurovascular status of affected part
6. Establish **VASCULAR ACCESS**

<table>
<thead>
<tr>
<th>Age</th>
<th>IV Fluid Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;5 y/o</td>
<td>125mL/hr</td>
</tr>
<tr>
<td>6-13 y/o</td>

<td>500mL/hr</td>
</tr>
</tbody>
</table>
7. Cover wounds with dry dressings
8. Contact Medical Control
9. Transport
   - Support ABCs
   - Observe
   - Keep warm

**Chemical Burns**
3. Refer to System-specific HazMat Procedure
4. If powdered chemical, brush away excess
5. Remove clothing if possible
6. Flush burn area with copious amounts of sterile water or saline ASAP and during transport

**ALS**
7. If EYE INVOLVEMENT:
   - Assess visual acuity
   - Remove contact lens and **IRRIGATE EYE WITH SALINE**
     ♦ Do not contaminate the uninjured eye with contaminated irrigation solution
8. Contact Medical Control
9. Transport
   - Support ABCs
   - Observe
   - Keep warm
### PEDIATRIC BURNS (THERMAL, ELECTRICAL, CHEMICAL)

**Electrical Burns**
3. **Spine Motion Restriction** as indicated  
4. Identify and document any entrance and exit wounds  
5. Assess neurovascular status of affected part  
6. Cover wounds with dry dressings  
7. Contact Medical Control  
8. Transport  
   - Support ABCs  
   - Observe  
   - Keep warm

**SPECIAL CONSIDERATIONS:**
- Assess for potential child abuse and follow appropriate reporting mechanism.  
- Keep the child warm and protect from hypothermia. Be cautious with cool dressings.  
- Consider FENTANYL 1 mcg/kg SLOW IV or IO/IM/IN, max dose 100 mcg. **No repeat dose.**  
- Consider transport to a Burn Center

---

Palm of hand (including fingers) of infant or child ~ 1% of the total body surface area
# Pediatric Near Drowning

**BLS / ALS**

1. Pediatric Initial Trauma Care SOP, p. 104-106
   - Consider need for **SPINAL MOTION RESTRICTION**, and airway maneuvers that will not compromise that restriction

• Refer to appropriate pediatric cardiac arrest SOP (**PEDIATRIC AED**, p. 84 or **PEDIATRIC PULSELESS ARREST**, p. 85)
SUSPECTED CHILD ABUSE / NEGLECT

BLS/ALS
1. Pediatric Initial Medical Care SOP, p. 79, or Pediatric Initial Trauma Care SOP, p. 104-106

2. Treat obvious injuries per appropriate SOP

3. History, physical exam, scene survey as usual, and document findings on patient care report

4. TRANSPORT. Report your suspicions to ED staff upon arrival.
   - Transport is mandatory
   - Contact Medical Control if parent/legal guardian is refusing

5. Notify Illinois Department of Children and Family Services (DCFS):
   - 1-800-25-ABUSE (24-hour phone line)
ADDENDUM SECTION

In order to move the science of Emergency Medical Services forward, the EMS Medical Directors have added this section to the SOPs.

Here, the Region will place protocols that are presently "System-specific." These SOPs may be used within a System in the Region, but at the present time are not universally in effect for all the Systems. Medical Control direction for these SOPs must come from a hospital in the System that uses these SOPs.

Examples:
- Use of Morgan Lens in Chemical Splash / Burns to the Eyes
- Adult Drug Assisted Intubation - Ketamine

It is our intention to distribute the System-specific SOPs to the entire Region to see, examine, evaluate and discuss so that they may be discussed within your primary System and evaluate their usefulness to the provider in the field.

We anticipate that all SOPs will be reviewed biennially. When this process takes place, the EMS Medical Directors will evaluate the Addendum Section and determine which of the System-specific SOPs will be added Region-wide.

Our intention is to utilize this section for the advancement of the Region as a whole, and to develop the finest EMS Region in the State.

Respectfully,

The Region 8 EMS Medical Directors
### ADDENDUM - USE OF MORGAN LENS IN CHEMICAL SPLASH / BURNS TO THE EYES

**ALS**

1. Instill **0.5% TETRACAINE 1 drop** to each affected eye. May repeat until pain is relieved.

2. Insert **MORGAN LENS** into eye using 1 L Normal Saline IV solution as irrigation fluid.

3. Open IV tubing roller clamp and adjust flow to a level that is well tolerated by the patient.

4. Continue irrigation while enroute to the hospital.

5. Patch unaffected eye.

**Note:** If the patient has exposed eye to adhesive/glue, do not force eyelids open. Gently irrigate using manual flushing until eye can be opened without difficulty. Contact Medical Control for further instructions.
ALS
This SOP is to be used for patients > 15 years of age. If ≤ 15 years of age, see Pediatric Drug Assisted Intubation – Versed SOP, p. 81.

1. Adult Initial Medical Care SOP, p. 4-5 - The following are situations which may require the use of this SOP to facilitate intubation:
   • Glasgow Coma Scale score of ≤ 8
   • Imminent respiratory arrest
   • Imminent tracheal/laryngeal closure due to severe edema secondary to trauma or anaphylaxis
   • Flail chest and/or open chest wounds with cyanosis and a respiratory rate < 10 or > 30

2. ALWAYS HAVE CRICOthyROIDOTOMY EQUIPMENT AVAILABLE

3. Prepare patient and equipment for procedure:
   • Position patient in sniffing position unless cervical spine injury suspected
   • Have suction with Yankauer or other rigid tip ready
   • Prepare all intubation and cricothyroidotomy equipment per System-specific procedure
   • HIGH FiO2 VENTILATION prior to and in-between steps of this procedure as able

4. BENZOCAINE spray to posterior pharynx (0.5-1 second spray x 2, 30 seconds apart)

5. Administer KETAMINE 1.0 mg/kg IV/IO
   • may repeat KETAMINE 0.5 mg/kg IV/IO after 2-3 min x 1 if insufficient sedation achieved

6. Attempt oral or oral in-line intubation via System-specific procedure

7. After passing of tube, verify placement:
   • Adequate chest expansion bilaterally and symmetrically
   • Positive bilateral breath sounds
   • Negative epigastric sounds
   • Waveform capnography, end tidal CO2 detector and/or esophageal detection device per System-specific procedure

8. Secure ET tube and reassess placement

POST INTUBATION SEDATION
9. Administer VERSED (midazolam) 2 mg increments IV/IO q 2 minutes up to 10 mg total as necessary

If unsuccessful, continue HIGH FiO2 VENTILATION, contact Medical Control, and be prepared for cricothyroidotomy per System-specific procedure.

</table>
| Glucagon       | Diabetic/Glucose Emergencies: 1 mg IM                  | Diabetic/Glucose Emergencies: 
> 8 years: 1 mg IM  
≤ 8 years: 0.5 mg IM  
Beta/Calcium Channel Blocker Overdose: 0.5 mg IV/IO, may repeat x 1 | Causes a breakdown of stored glycogen into glucose.  
Independent of beta blockade, positive inotropic and chronotropic and improved AV conduction. | Hypoglycemic patient without venous access.  
Beta or calcium channel blocker overdose with symptomatic bradycardias including AV blocks (dosage required usually exceeds that available in pre-hospital setting). | Hypersensitivity to glucagon or proteins.  
Nausea/vomiting, dizziness, headache. | |
| Glucose, oral  | One tube (15 g of delivered glucose)                   |                                               | Carbohydrate, increases serum glucose level (onset of approximately 10 minutes). | Hypoglycemia in patients with normal mental status and intact gag reflex.  
Altered mental status, no gag reflex.  
Nausea, potential for aspiration in patients with impaired airway reflexes. | |
| Ketamine       | 1 mg/kg slow IV/IO (over 30-60 seconds)  
May repeat 0.5 mg/kg slow IV/IO (over 30-60 seconds) if insufficient sedation achieved | NOT FOR PEDIATRIC USE     | Produces anesthetic state characterized by profound analgesia with minimal cardiovascular or respiratory effects.  
Rapid onset (< 1 min) and short-duration (half-life ~ 10 min). | Adult Drug Assisted Intubation requiring sedation  
Known or suspected schizophrenia  
Muscular tonicity with random purposeless movements, hiccoughing, transient laryngospasm, transient apnea or respiratory depression, nausea & vomiting, recovery agitation. | |
| Lidocaine      | 1 mg/kg (max dose 100 mg) increments up to 3 mg/kg IV/IO  
IV/IO bolus at 0.5 mg/kg increments (max dose 50 mg) | NOT FOR PEDIATRIC USE     | Exerts antidyssrhythmic action by suppressing automaticity in the His-Purkinje system and by elevating electrical stimulation threshold for ventricular dysrhythmias. Use to lower the threshold for electrical conversion. | Pre-and post-defibrillation in ventricular fibrillation and unstable ventricular tachycardia, persistent stable ventricular tachycardia.  
AV blocks, ST-elevation in leads II, III and aVF (possible Inferior Wall MI), bleeding, thrombocytopenia, known sensitivity to lidocaine, sulfite or paraben.  
Use with caution if history of liver or renal disease, CHF, hypoxia or elderly.  
Toxicity (signs may include anxiety, apprehension, euphoria, nervousness, disorientation, dizziness, blurred vision, other CNS changes), seizures without warning, hypotension, pain at injection site. | |

**Classification:**
- Glucagon (GlucaGen):
  - Hormone, antihypoglycemic agent
- Glucose, oral (Glucose 15):
  - Oral antihypoglycemic agent
- Ketamine (Ketalar):
  - Nonbarbiturate anesthetic
- Lidocaine (Xylocaine):
  - Antiarrhythmic (Class 1b)
